

Deployment Challenge

Goal

Deploy an ASP.NET MVC website to IIS or Microsoft Azure. Verify it works.

Bonus

Include authentication in the ASP.NET MVC website. When you deploy, make sure that you change to a “real” SQL database (not LocalDB) and make sure you don’t have to change any deployed files to get the new database to work (don’t cheat and point to the new database for development too).

“Practice makes the master.”
