

# Weekly Challenge

## ASP.NET Core with Docker

### Primary Challenge

Create an ASP.NET Core website (Razor pages or MVC) and run it in Docker. Verify that you can make changes and get them into the container. Ensure the site redirects from HTTP to HTTPS.

### Bonus Challenge

Build an Azure DevOps pipeline that builds your Docker container whenever you commit your code to the master branch in git and push it up to Azure DevOps (you don't need to deploy it if you don't want).

*“Practice makes the master.”*

— Patrick Rothfuss
