## U3C9 Objects and Classes

---

CONSTRUCTORS

ERIC Y. CHOU, PH.D.

IEEE SENIOR MEMBER

# Constructors

---

Constructors are a special kind of methods that are invoked to construct objects.

```
Circle() {  
}
```

```
Circle(double newRadius) {  
    radius = newRadius;  
}
```

# Constructors, cont.

---

A **constructor** with no parameters is referred to as a *no-arg constructor*. If no constructor is given, default one will be used.

- Constructors must have the same name as the class itself.
- Constructors do not have a return type—not even void.
- Constructors are invoked using the new operator when an object is created. Constructors play the role of initializing objects.

# Creating Objects Using Constructors

---

```
new ClassName ();
```

**Example:**

```
new Circle ();
```

```
new Circle (5.0);
```

# Declaring Object Reference Variables

---

To reference an object, assign the object to a reference variable. For an object, you may have as many reference variable (pointer) as you wish.

To declare a reference variable, use the syntax:

```
ClassName objectRefVar;
```

**Example:**

```
Circle myCircle;
```

# Declaring/Creating Objects in a Single Step

---

```
ClassName objectRefVar = new ClassName();
```

**Example:**

```
Circle myCircle = new Circle();
```

# Accessing Object's Members (Properties or Methods)

---

Referencing the object's data:

```
objectRefVar.data
```

*e.g.*, `myCircle.radius`

Invoking the object's method:

```
objectRefVar.methodName (arguments)
```

*e.g.*, `myCircle.getArea ()`

# Trace Code

---

Declare myCircle

```
Circle myCircle = new Circle(5.0);
```

```
Circle yourCircle = new Circle();
```

```
yourCircle.radius = 100;
```

myCircle

no value

# Trace Code

---

```
Circle myCircle = new Circle(5.0);
```

myCircle

no value

```
Circle yourCircle = new Circle();
```

```
yourCircle.radius = 100;
```

: Circle

radius: 5.0

Create a circle

# Trace Code

```
Circle myCircle = new Circle(5.0);
```

```
Circle yourCircle = new Circle();
```

```
yourCircle.radius = 100;
```

myCircle reference value

Assign object reference  
to myCircle

# Trace Code

```
Circle myCircle = new Circle(5.0);
```

```
Circle yourCircle = new Circle();
```

```
yourCircle.radius = 100;
```

myCircle reference value

<u>: Circle</u>
radius: 5.0

yourCircle no value

Declare yourCircle

# Trace Code

```
Circle myCircle = new Circle(5.0);
```

```
Circle yourCircle = new Circle();
```

```
yourCircle.radius = 100;
```

myCircle reference value

yourCircle no value

Create a new  
Circle object

# Trace Code

```
Circle myCircle = new Circle(5.0);
```

```
Circle yourCircle = new Circle();
```

```
yourCircle.radius = 100;
```

myCircle reference value

yourCircle reference value

Assign object reference  
to yourCircle

# Trace Code

```
Circle myCircle = new Circle(5.0);
```

```
Circle yourCircle = new Circle();
```

```
yourCircle.radius = 100;
```

myCircle reference value

yourCircle reference value

Change radius in  
yourCircle

# Caution

(static members belong to a class, non-static members belongs to objects)

---

Recall that you use

Math.methodName(arguments) (e.g., Math.pow(3, 2.5))

to invoke a method in the Math class. Can you invoke getArea() using Circle.getArea()? The answer is no. All the methods used before this chapter are static methods, which are defined using the static keyword. However, getArea() is non-static. It must be invoked from an object using

objectRefVar.methodName(arguments) (e.g., myCircle.getArea()).

More explanations will be given in the section on “Static Variables, Constants, and Methods.”
