

Hi, this is Justin Putney. I'm the creator of in5.

In this course, I'm going to show you concrete steps to make your documents more accessible. We'll first address why accessibility is so important and how you'll get search engine optimization or SEO as a bonus when you improve the accessibility in your documents. You'll learn how to use your web browser's developer tools for quick accessibility testing. You'll learn how to create alt text for images and text frames, and how to create an easy mobile reading experience while preserving your pixel perfect InDesign layout. You'll also learn how to enable keyboard navigation and optimize your output for screen readers.

This course was originally recorded from a live webinar, but during the course of the Q & A on the webinar, we realized how in5 could deliver even better accessibility. So we've added new features in version 3.8 of in5, based on the discussions we had in the Q & A. We also recorded an additional section to this course to help you navigate the new Accessibility Panel in order to: customize tags, ARIA roles, control which elements are visible (or hidden) to screen readers and how you can create a Skip Link that only appears to users who are navigating using their keyboard.

We've also included the full original Q & A as a bonus at the end of this course. Are you ready to create awesome interactive documents from InDesign without coding? Let's get started.
