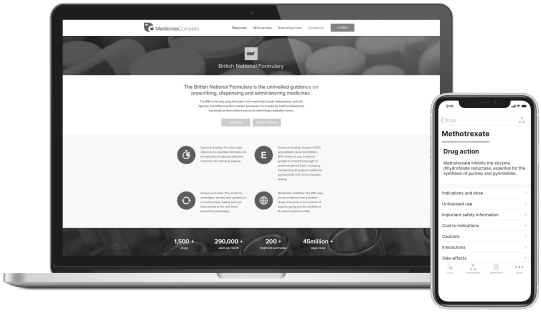
BNF | BNF for Children

The first choice for concise medicines information

Trusted by healthcare professionals in the UK and across the world, British National Formulary (BNF) and BNF for Children support confident decision-making at the point of care.

BNF and BNF for Children are updated monthly through the online platform MedicinesComplete and via the BNF app. In print, BNF is updated twice a year and BNF for Children annually. FormularyComplete enables you to create and manage your own local formulary online, built on BNF and BNF for Children advice.



How to access the BNF

NHS Eligible Individuals

Eligible healthcare professionals in the UK benefit from a print copy of the BNF and BNF for Children each September, and online access provided through MedicinesComplete and the BNF app.

- For print, refer to page ii, call 01268 495 609 or email **BNF@wilmingtonhealthcare.com**.
- To register as an NHS user for access through MedicinesComplete go to **about.medicinescomplete.com/registration**.
- Download the BNF app from your iOS or Android app store.

Access BNF and BNF for Children alongside other best practice and evidence-based guidance from NICE at **www.nice.org.uk**.

In **Northern Ireland**:
Primary care: contact the Business Services Organisation
Secondary care: contact your local Trust pharmacy department

About BNF for Children content
The BNF for Children is for rapid reference by UK health professionals engaged in prescribing, dispensing, and administering medicines to children.

BNF for Children has been constructed using robust procedures for gathering, assessing and assimilating information on paediatric drug treatment, but may not always include all the information necessary for prescribing and dispensing. It is expected that the reader will be relying on appropriate professional knowledge and expertise to interpret the contents in the context of the circumstances of the individual child. BNF for Children should be used in conjunction with other appropriate and up-to-date literature and, where necessary, supplemented by expert advice. Information is also available from Medicines Information Services.

Special care is required in managing childhood conditions with unlicensed medicines or with licensed medicines for unlicensed uses. Responsibility for the appropriate use of medicines lies solely with the individual health professional.

Please refer to digital versions of BNF for Children for the most up-to-date content. BNF for Children is published in print but interim updates are issued and published in the digital versions of BNF for Children. The publishers work to ensure that the information is as accurate and up-to-date as possible at the date of publication, but knowledge and best practice in this field change regularly. BNF for Children's accuracy and currency cannot be guaranteed and neither the publishers nor the authors accept any responsibility for errors or omissions. While considerable efforts have been made to check the material in this publication, it should be treated as a guide only. Prescribers, pharmacists and other healthcare professionals are advised to check www.bnf.org for information about key updates and corrections.

Pharmaid
Numerous requests have been received from developing countries for the BNF for Children. The Pharmaid scheme of the Commonwealth Pharmacists Association will dispatch old copies of the BNF for Children to certain Commonwealth countries. For more information on this scheme see commonwealthpharmacy.org/what-we-do/pharmaid/.
If you would like to donate your copy email:
admin@commonwealthpharmacy.org

Preface

BNF for Children aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information on the use of medicines for treating children.

A joint publication of the British Medical Association, the Royal Pharmaceutical Society, the Royal College of Paediatrics and Child Health, and the Neonatal and Paediatric Pharmacists Group, BNF for Children is published under the authority of a Paediatric Formulary Committee which comprises representatives of these bodies, the Department of Health for England, and the Medicines and Healthcare products Regulatory Agency.

Many areas of paediatric practice have suffered from inadequate information on effective medicines. BNF for Children addresses this significant knowledge gap by providing practical information on the use of medicines in children of all ages from birth to adolescence. Information in BNF for Children has been validated against emerging evidence, best-practice guidelines, and crucially, advice from a network of clinical experts.

Drawing information from manufacturers' literature where appropriate, BNF for Children also includes a great deal of advice that goes beyond marketing authorisations (product licences). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy; local paediatric formularies, clinical literature and national information resources have been invaluable in this process.

BNF for Children has been designed for rapid reference and the information presented has been carefully selected to aid decisions on prescribing, dispensing and administration of medicines. Less detail is given on areas such as malignant disease and the very specialist use of medicines generally undertaken in tertiary centres. BNF for Children should be interpreted in the light of professional knowledge and it should be supplemented as necessary by specialised publications. Information is also available from Medicines Information Services (see inside front cover).

It is **important** to use the most recent BNF for Children information for making clinical decisions. The print edition of BNF for Children is updated in September each year. Monthly updates are provided online via the BNF Publications website www.bnf.org, MedicinesComplete and the NHS Evidence portal. The more important changes listed under Changes p. xviii are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of BNF for Children—including versions for mobile devices and integration into local formularies—are also available.

BNF Publications welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:

Valuable advice has been provided by the following expert groups: Advisory Committee on Malaria Prevention, Association of British Paediatric Nurses, British Association of Dermatologists' Therapy & Guidelines Sub-committee, British Association for Paediatric Nephrology, British Oncology Pharmacy Association, British Paediatric Allergy, Immunisation & Infection Group, British Paediatric Neurology Association, British Pain Society, British Society for Allergy & Clinical Immunology, British Society for Antimicrobial Chemotherapy, British Society of Gastroenterology, British Society for Paediatric Endocrinology and Diabetes, British Society of Paediatric Gastroenterology, Hepatology and Nutrition, British Society of Rheumatology, College of Mental Health Pharmacy, Faculty of Sexual and Reproductive Healthcare, ENT UK, National Poisons Information Service & TOXBASE, Neonatal and Paediatric Pharmacists Group, Public Health England, Royal College of Anaesthetists, Royal College of Obstetricians and Gynaecologists, Royal College of Ophthalmologists, Royal College of Paediatrics and Child Health, Royal College of Pathologists, Royal College of Physicians, Royal College of Psychiatrists, UK Teratology Information Service.

The BNF team includes specialist pharmacists from the Evelina London Children's Hospital, who bring valuable experience in the use of medicines in paediatric care.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF for Children.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

The BNF team are grateful for the support and access to in-house expertise at Pharmaceutical Press and acknowledge the assistance of K. Baxter, A. Naylor, J. Macdonald, N. Potter and their teams.

W. Ahmed, H. Arshad, A. Devanand, H. Iqbal, S. Khan, J. Kwarteng, C. Lam, A. Mahmood, H. Osman, K. Pradhan, T. Tahmasi, and H. Tan provided considerable assistance during the production of this update of the BNF for Children.

How BNF Publications are constructed

Overview

The BNF for Children is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals involved in the care of children. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

Hundreds of changes are made between print editions, and are published monthly in a number of digital formats. The most clinically significant updates are listed under Changes p. xviii.

BNF for Children is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information.

Information in BNF for Children has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts. BNF for Children includes a great deal of advice that goes beyond marketing authorisations (product licences or summaries of product characteristics). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy.

Validation of information follows a standardised process. Where the evidence base is weak, further validation may be undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

Paediatric Formulary Committee

The Paediatric Formulary Committee (PFC) is responsible for the content of BNF for Children. The PFC comprises pharmacy, medical, and nursing representatives with a paediatric background, and lay representatives who have worked with children or acted as a carer of a paediatric patient; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA) and the Department of Health for England. The PFC decides on matters of policy and reviews amendments to BNF for Children in the light of new complex or contentious evidence and expert advice.

Dental Advisory Group

The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers' Advisory Group

The Nurse Prescribers' Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers' Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Expert advisers

BNF for Children uses representatives from expert groups (professional societies and advisory bodies) to provide expert advice on clinical content. These expert advisers are practice-based healthcare professionals (including doctors, pharmacists, nurses, and dentists), and are regarded as specialists in their field. The role of these expert advisers is to provide independent advice on their area of expertise by reviewing existing text and commenting on amendments drafted by the clinical writers. These clinical experts help to ensure that BNF for Children remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on the use of unlicensed medicines or of licensed medicines for unlicensed uses ('off-label' use).

BNF for Children may also call on other clinical specialists for specific developments when particular expertise is required.

BNF for Children works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and for assimilation into BNF for Children.

Editorial team

BNF for Children clinical writers have worked as pharmacists or possess a pharmacy degree and many have a further, relevant post-graduate qualification; they therefore have a sound understanding of how drugs are used in clinical practice. A number of the clinical writers have specific experience of paediatric practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNF for Children content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In addition, review of content is carried out proactively, with the aim of considering all recommendations for review every 3 to 4 years.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria defines when content is referred to expert advisers, the Paediatric Formulary Committee or other advisory groups, or submitted for peer review.

Clinical writers prepare the text for publication and undertake a number of validation checks at various stages of the content creation process.

Sources of BNF for Children information

BNF for Children uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics

BNF for Children reviews the summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are a key source of product information and are carefully processed. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (BNF for Children is committed to using approved names and descriptions as laid down by the Human Medicines Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into BNF for Children using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content approver; changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature

Clinical writers monitor and process various sources of information on a regular basis. When a difference between the advice in BNF for Children and the source is noted, the new information is assessed for reliability (using tools based on SIGN methodology if appropriate) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Paediatric Formulary Committee. BNF for Children enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify 'triggers' for changing the content, systematic literature searches are used to identify the best quality evidence available to inform

an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.

Consensus guidelines

The advice in BNF for Children is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to BNF for Children; it is therefore possible to ensure that a consistent message is disseminated. BNF for Children routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the All Wales Medicines Strategy Group (AWMSG), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources

Paediatric formularies and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF for Children team works closely with the editorial team that produces *Martindale: The Complete Drug Reference*. BNF for Children has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Peer review

Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While BNF for Children has the valuable support of expert advisers and the Paediatric Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice.

Content for open peer review is posted on bnf.org and interested parties are notified via a number of channels, including the BNF e-newsletter.

Statutory information

BNF for Children routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription Only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that BNF for Children complies with the relevant sections of the Human Medicines Regulations 2012.

BNF for Children maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in BNF for Children as are guidelines from bodies such as the Royal College of Paediatrics and Child Health.

Medicines and devices

NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in BNF for Children.

Comments from readers

Readers of BNF for Children are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that BNF for Children provides practical and clinically relevant information. Many changes in the presentation and scope of BNF for Children have resulted from comments sent in by users.

Comments from industry

Close scrutiny of BNF for Children by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF for Children's presentation of the role of various drugs; this is yet another check on the balance of BNF for Children's advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research

Market research is conducted at regular intervals to gather feedback on specific areas of development.

Assessing the evidence

From January 2016, recommendations made in BNF for Children have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision-making based on the best available evidence.

Recommendations from summaries of product characteristics

Recommendations from summaries of product characteristics (SPCs) and other product literature are either preceded by "manufacturer advises" or have the symbol M (manufacturer information) displayed next to the recommendation within the text.

Grading system

BNF for Children has adopted a five-level grading system from A to E, based on the former SIGN grading system. This grade is displayed next to the recommendation within the text.

Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II or SIGN and then assigned a level of evidence. The recommendation is given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

Levels of evidence

- **Level 1++**
  High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**
  Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1–**
  Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2++**
  High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2+**
  Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2–**
  Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**
  Non-analytic studies, e.g. case reports, case series.
- **Level 4**
  Expert advice or clinical experience from respected authorities.

Grades of recommendation

- **Grade A: High strength**
  NICE-accredited guidelines; or other guidelines, assessed using AGREE II, that meet the grade A threshold; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results.
- **Grade B: Moderate strength**
  Guidelines, assessed using AGREE II, that meet the grade B threshold; or a body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.

- **Grade C: Low strength**
  Guidelines, assessed using AGREE II, that meet the grade C threshold; or a body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2++.
- **Grade D: Very low strength**
  Guidelines, assessed using AGREE II, that meet the grade D threshold; or evidence level 3; or extrapolated evidence from studies rated as 2+; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.
- **Grade E: Practice point**
  Evidence level 4.

How to use BNF Publications in print

How to use the BNF for Children in print

This edition of the BNF for Children continues to display the fundamental change to the structure of the content that was first shown in BNF for Children 2015-2016. The changes were made to bring consistency and clarity to BNF for Children content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

- Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
- Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 374), a drug class monograph has been created to contain the common information.
- Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
- Section numbering – the BNF and BNF for Children section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF for Children, where drugs had different therapeutic uses in children.
- Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 14.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF for Children effectively, and keep up to date with significant changes in the BNF for Children that are relevant to their clinical practice. This *How to Use the BNF for Children* is key in reinforcing the details of the new structure of the BNF for Children to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

As with previous editions, the BNF for Children provides information on the use of medicines in children ranging from neonates (including preterm neonates) to adolescents. The terms infant, child, and adolescent are not used consistently in the literature; to avoid ambiguity actual ages are used in the dose statements in BNF for Children. The term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent in BNF for Children.

Structure of the BNF for Children

This BNF for Children edition continues to broadly follow the high level structure of earlier editions of the BNF for Children (i.e. those published before BNF for Children 2015-2016):

Front matter, comprising information on how to use the BNF for Children, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).

Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. Asthma, acute p. 164), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta$_2$-agonist bronchodilators) and then alphabetically within each classification (e.g. Formoterol fumarate, Salbutamol, Salmeterol, Terbutaline sulfate).

Appendices, covering interactions, borderline substances, and cautionary and advisory labels.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers' contact details, and the index. Quick reference guides for life support and key drug doses in medical emergencies are also included, for ease of access.

Navigating the BNF for Children

The contents page provides the high-level layout of information within the BNF for Children; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the *thumbnail*), alongside the chapter title. The top of the page includes the therapeutic use (the *running head*) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types

Treatment summaries

Treatment summaries are of three main types;

- an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 805),
- a comparison between a group or groups of drugs (e.g. Beta-adrenoceptor blocking drugs p. 114),
- an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 110, or Malaria, prophylaxis p. 442).

In order to select safe and effective medicines for individual children, information in the treatment summaries must be

used in conjunction with other prescribing details about the drugs and knowledge of the child's medical and drug history.

Monographs

Overview

In earlier editions (i.e. before BNF for Children 2015-2016), a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate p. 308 was found in chapter 1, for its antimotility effects and chapter 4 for its analgesic effects. However, the monograph in chapter 1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate p. 308 is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

Nomenclature

Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 50) or for drugs that are related to a drug class monograph (see Drug class monographs, p. xvi).

Indication and dose

User feedback has highlighted that one of the main uses of the BNF for Children is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the child should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. neonates) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

Selecting the dose

The dose of a drug may vary according to different indications, routes of administration, age, body-weight, and body surface area. The right dose should be selected for the right age and body-weight (or body surface area) of the child, as well as for the right indication, route of administration, and preparation.

In earlier editions of the BNF for Children, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a child is considered to be 11 up until the point of their 12th birthday, meaning that an age range of child 12 to 17 years is applicable to a child from the day of their 12th birthday until the day before their 18th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a child up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 59 kg is applicable to a child as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

A pragmatic approach should be applied to these cut-off points depending on the child's physiological development, condition, and if weight is appropriate for the child's age.

For some drugs (e.g. vancomycin p. 371) the neonatal dose varies according to the *corrected gestational* age of the neonate. Corrected gestational age is the neonate's total age expressed in weeks from the start of the mother's last menstrual period. For example, a 3 week old baby born at 27 weeks gestation is treated as having a corrected gestational age of 30 weeks. A term baby has a corrected gestational age of 37–42 weeks when born. For most other drugs, the dose can be based on the child's actual date of birth irrespective of corrected gestational age. However, the degree of prematurity, the maturity of renal and hepatic function, and the clinical properties of the drug need to be considered on an individual basis.

Many children's doses in BNF for Children are standardised by *body-weight*. To calculate the dose for a given child the weight-standardised dose is multiplied by the child's weight (or occasionally by the child's ideal weight for height). The calculated dose should not normally exceed the maximum recommended dose for an adult. For example, if the dose is 8 mg/kg (max. 300 mg), a child of 10 kg body-weight should receive 80 mg, but a child of 40 kg body-weight should receive 300 mg (rather than 320 mg). Calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, the dose should be calculated from an ideal weight for height.

Occasionally, some doses in BNF for Children are standardised by *body surface area* because many physiological phenomena correlate better with body surface area. In these cases, to calculate the dose for a given child, the body surface area-standardised dose is multiplied by the child's body surface area. The child's body surface area can be estimated from his or her weight using the tables for Body surface area in children (image) p. 1287.

Wherever possible, doses are expressed in terms of a definite frequency (e.g. if the dose is 1 mg/kg twice daily, a child of body-weight 9 kg would receive 9 mg twice daily). Occasionally, it is necessary to include doses in the total

daily dose format (e.g. 10 mg/kg daily in 3 divided doses); in these cases the total daily dose should be divided into individual doses (in this example a child of body-weight 9 kg would receive 30 mg 3 times daily).

Most drugs can be administered at slightly irregular intervals during the day. Some drugs, e.g. antimicrobials, are best given at regular intervals. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child's bedtime.

Special care should be taken when converting doses from one metric unit to another, and when calculating infusion rates or the volume of a preparation to administer. Where possible, doses should be rounded to facilitate administration of suitable volumes of liquid preparations, or an appropriate strength of tablet or capsule.

Other information relevant to Indication and dose

The dose panel also contains, where known, an indication of **pharmacokinetic considerations** that may affect the choice of dose, and **dose equivalence** information, which may aid the selection of dose when switching between drugs or preparations.

The BNF for Children includes **unlicensed use** of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF for Children recommends an unlicensed medicine or the 'off-label' use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

Minimising harm and drug safety

The drug chosen to treat a particular condition should minimise the patient's susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient's other diseases. To achieve this, the *Contra-indications*, *Cautions* and *Side-effects* of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient's quality of life should also be assessed. For instance, in a child who has constipation, it may be preferable to avoid a drug that frequently causes constipation.

The *Important safety advice* section in the BNF for Children, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

Use of drugs in specific patient populations

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in hepatic impairment p. 15, and Prescribing in renal impairment p. 15. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under *Hepatic impairment* and *Renal impairment* (e.g. fluconazole p. 431).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in pregnancy p. 18 and Prescribing in breast-feeding p. 18. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy or breast-feeding (e.g. Venous thromboembolism p. 96). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under *Pregnancy*, and *Breast-feeding* (e.g. fluconazole p. 431).

A new section, *Conception and contraception*, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 852) has been included.

Administration and monitoring

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called *Pre-treatment screening* (e.g. abacavir p. 476). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A *Directions for administration* section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 311) and further details, such as masking the bitter taste of some medicines.

Whenever possible, intramuscular injections should be **avoided** in children because they are painful.

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The *Monitoring* section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 183). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin p. 657), and this information is included in *Effects on laboratory tests*.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 113); these are covered under *Treatment cessation*.

Choice and supply

The prescriber, the child's carer, and the child (if appropriate) should agree on the health outcomes desired and on the strategy for achieving them. Taking the time to explain to the child (and the child's carer if appropriate) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 404, or recognising signs of blood, liver, or skin disorders with carbamazepine p. 218); this is shown in *Patient and carer advice*.

Typical layout of a monograph and associated medicinal forms

❶ Class Monographs and drug monographs

In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle:

Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol: 1234

The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications

❷ Drug classifications

Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants)

❸ Review date

The date of last review of the content

❹ Specific preparation name

If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name

Class monograph ❶

CLASSIFICATION ❷

1234

Drug monograph ❶ ❸ 01-Jun-2017

(Synonym) another name by which a drug may be known

- **DRUG ACTION** how a drug exerts its effect in the body

- **INDICATIONS AND DOSE**

Indications are the clinical reasons a drug is used. The dose of a drug will often depend on the indications

Indication

- ROUTE
- Age groups: [Neonate/Child]
  Dose and frequency of administration (max. dose)

SPECIFIC PREPARATION NAME ❹

Indication

- ROUTE
- Age groups: [Neonate/Child]
  Dose and frequency of administration (max. dose)

DOSE ADJUSTMENTS DUE TO INTERACTIONS dosing information when used concurrently with other drugs

DOSES AT EXTREMES OF BODY-WEIGHT dosing information for patients who are overweight or underweight

DOSE EQUIVALENCE AND CONVERSION information around the bioequivalence between formulations of the same drug, or equivalent doses of drugs that are members of the same class

PHARMACOKINETICS how the body affects a drug (absorption, distribution, metabolism, and excretion)

POTENCY a measure of drug activity expressed in terms of the concentration required to produce an effect of given intensity

- **UNLICENSED USE** describes the use of medicines outside the terms of their UK licence (off-label use), or use of medicines that have no licence for use in the UK

IMPORTANT SAFETY INFORMATION
Information produced and disseminated by drug regulators often highlights serious risks associated with the use of a drug, and may include advice that is mandatory

- **CONTRA-INDICATIONS** circumstances when a drug should be avoided
- **CAUTIONS** details of precautions required
- **INTERACTIONS** when one drug changes the effects of another drug; the mechanisms underlying drug interactions are explained in Appendix 1
- **SIDE-EFFECTS** listed in order of frequency, where known, and arranged alphabetically
- **ALLERGY AND CROSS-SENSITIVITY** for drugs that carry an increased risk of hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** potential for a drug to have harmful effects on an unborn child when prescribing for a woman of childbearing age or for a man trying to father a child; information on the effect of drugs on the efficacy of latex condoms or diaphragms

- **PREGNANCY** advice on the use of a drug during pregnancy
- **BREAST FEEDING** EvGr advice on the use of a drug during breast feeding Ⓐ ❺
- **HEPATIC IMPAIRMENT** advice on the use of a drug in hepatic impairment
- **RENAL IMPAIRMENT** advice on the use of a drug in renal impairment
- **PRE-TREATMENT SCREENING** covers one off tests required to assess the suitability of a patient for a particular drug
- **MONITORING REQUIREMENTS** specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index
- **EFFECTS ON LABORATORY TESTS** for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests
- **TREATMENT CESSATION** specifies whether further monitoring or precautions are advised when the drug is withdrawn
- **DIRECTIONS FOR ADMINISTRATION** practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration
- **PRESCRIBING AND DISPENSING INFORMATION** practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary
- **HANDLING AND STORAGE** includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions
- **PATIENT AND CARER ADVICE** for drugs with a special need for counselling
- **PROFESSION SPECIFIC INFORMATION** provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS
- **NATIONAL FUNDING/ACCESS DECISIONS** references to NICE Technology Appraisals, SMC advice and AWMSG advice
- **LESS SUITABLE FOR PRESCRIBING** preparations that are considered by the Paediatric Formulary Committee to be less suitable for prescribing
- **EXCEPTION TO LEGAL CATEGORY** advice and information on drugs which may be sold without a prescription under specific conditions

- **MEDICINAL FORMS**

Form

CAUTIONARY AND ADVISORY LABELS if applicable
EXCIPIENTS clinically important but not comprehensive [consult manufacturer information for full details]
ELECTROLYTES if clinically significant quantities occur

▸ **Preparation name** (Manufacturer/Non-proprietary)
Drug name and strength pack sizes PoM ❻ Prices

Combinations available this indicates a combination preparation is available and a cross reference page number is provided to locate this preparation

❺ Evidence grading

Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades Ⓐ Ⓑ Ⓒ Ⓓ Ⓔ are displayed next to the recommendations within the text, and are preceded by the symbol: EvGr

The symbol Ⓜ indicates manufacturer information

For further information, see How BNF Publications are constructed

❻ Legal categories

PoM This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

CD1 CD2 CD3 CD4–1 CD4–2 CD5 These symbols indicate that the preparations are subject to the prescription requirements of the Misuse of Drugs Act

For regulations governing prescriptions for such preparations, see Controlled Drugs and Drug Dependence

Not all monographs include all possible sections; sections are only included when relevant information has been identified

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products are not interchangeable e.g. modified-release theophylline p. 183), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 131), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 52).

Medicinal forms

In the BNF for Children, preparations follow immediately after the monograph for the drug that is their main ingredient.

In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 37).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of "Medicinal Form" that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNF Publications appears online on MedicinesComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of "Modified release capsule" will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNF for Children, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in earlier BNF for Children versions, e.g. sodium acid phosphate, is now sodium dihydrogen phosphate anhydrous.

Children should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

Earlier editions of the BNF for Children only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 1242. These labels have now been applied at the level of the dose form.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.

Prices in the BNF for Children

Basic NHS **net prices** are given in the BNF for Children to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/dictionary-medicines-and-devices-dmd). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (services.nhsbsa.nhs.uk/dmd-browser/). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF for Children as prices vary between different manufacturers.

BNF for Children prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff), Scotland (www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.hscbusiness.hscni.net/services/2034.htm); prices in the different tariffs may vary.

Drug class monographs

In earlier editions of the BNF for Children, information relating to a class of drug sharing the same properties (e.g. tetracyclines p. 403), was contained within the prescribing notes. In the updated structure, drug class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag (e.g. beta-adrenoceptor blockers (systemic) p. 115). If a drug monograph has a corresponding class monograph, that needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag F 1234 (e.g. metoprolol tartrate p. 119). Within this flag, the page number of the drug class monograph is provided (e.g. 1234), to help navigate the user to this information. This is particularly useful where occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the drug class monograph (e.g. sotalol hydrochloride p. 85).

Other content

Nutrition

Appendix 2 includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Other useful information

Finding significant changes in the BNF for Children

- ***Changes***, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF for Children, as well as a list of preparations that have been discontinued and removed from the BNF for Children. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNF for Children, that not all of them can be accommodated in the *Changes* section. We encourage healthcare professionals to review regularly the prescribing information on drugs that they encounter frequently;
- ***Changes to the Dental Practitioners' Formulary***, are located at the end of the Dental List;
- ***E-newsletter***, the BNF & BNF for Children e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to www.bnf.org.

Using other sources for medicines information

The BNF for Children is designed as a digest for rapid reference. Less detail is given on areas such as malignant disease and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. The BNF for Children should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.

Changes

Monthly updates are provided online via Medicines Complete and the NICE BNF for Children website. The changes listed below are cumulative (from one print edition to the next).

Significant changes

Significant changes that appear in the print edition of BNF for Children 2022 — 2023:

- Aciclovir p. 464: important safety information added to highlight different approaches to calculating doses depending on the age of the child.
- Acne p. 847: updated guidance on management.
- Adrenaline/epinephrine auto-injectors p. 149: reminder for prescribers to support safe and effective use [MHRA/CHM advice].
- Amiodarone hydrochloride p. 83 (*Cordarone X*®): reminder of risks of treatment and need for patient monitoring and supervision [MHRA/CHM advice].
- Antihistamines, allergen immunotherapy and allergic emergencies p. 186: updated guidance for the management of anaphylaxis.
- Atezolizumab (*Tecentriq*®) and other immune-stimulatory anti-cancer drugs: risk of severe cutaneous adverse reactions (SCARs) [MHRA/CHM advice] (advice in ipilimumab, pembrolizumab; see example in ipilimumab p. 601).
- Bacillus Calmette-Guérin vaccine p. 877: updated guidance for immunisation of neonates in-line with Public Health England/UK Health Security Agency recommendations.
- Chloral hydrate p. 327, cloral betaine (*Welldorm*®): restriction of paediatric indication [MHRA/CHM advice].
- Chloramphenicol eye drops p. 769 containing borax or boric acid buffers: use in children younger than 2 years [MHRA/CHM advice].
- Chlorhexidine p. 560 [primary therapeutic area changed to genito-urinary system, secondary therapeutic area changed to oropharynx].
- Chloroquine p. 451: increased risk of cardiovascular events when used with macrolide antibiotics; reminder of psychiatric reactions [MHRA/CHM advice].
- Contraceptives, interactions p. 566: updated guidance.
- COVID-19 p. 456: updated guidance (updated July 2021).
- COVID-19 p. 456: updated guidance (updated January 2022).
- COVID-19 p. 456: updated guidance (updated March 2022).
- COVID-19 p. 456: updated guidance (updated May 2022).
- COVID-19 vaccine p. 903: reports of myocarditis and pericarditis with the Pfizer/BioNTech and Moderna vaccines.
- COVID-19 vaccine: title changed to COVID-19 vaccines p. 878 (updated December 2021).
- COVID-19 vaccine p. 903: update to age range of Pfizer/BioNTech vaccine (*Comirnaty*®) for immunisation against COVID-19.
- COVID-19 vaccines p. 878: updated guidance in-line with Public Health England recommendations (updated July 2021).
- COVID-19 vaccines p. 878: updated guidance in-line with Public Health England recommendations (updated October 2021).
- COVID-19 vaccines p. 878: updated guidance in-line with Public Health England/UK Health Security Agency recommendations (updated December 2021).
- COVID-19 vaccines p. 878: updated guidance in-line with Public Health England/UK Health Security Agency recommendations (updated January 2022).
- COVID-19 vaccines p. 878: updated guidance in-line with UK Health Security Agency recommendations (updated February 2022).
- COVID-19 vaccines p. 878: updated guidance in-line with UK Health Security Agency recommendations (updated March 2022).
- COVID-19 vaccines p. 878: updated guidance in-line with UK Health Security Agency recommendations (updated April 2022).
- Diabetic hyperglycaemic emergencies p. 516: updated guidance.
- Diabetic Ketoacidosis: title changed to Diabetic hyperglycaemic emergencies p. 516.
- Ear p. 780: updated guidance for the management of acute otitis media.
- Eczema p. 822: updated guidance on the management of infection.
- Emergency contraception p. 565: updated guidance.
- Gastro-intestinal system infections, antibacterial therapy p. 342: updated guidance on the management of *Clostridioides difficile* infection.
- Human papillomavirus vaccine p. 883: updated guidance in-line with UK Health Security Agency recommendations.
- Hydroxychloroquine sulfate p. 728: increased risk of cardiovascular events when used with macrolide antibiotics; reminder of psychiatric reactions [MHRA/CHM advice].
- Immunisation schedule p. 876: updated guidance for immunisation against human papillomavirus and influenza.
- Immunisation schedule p. 876: updated guidance for immunisation of neonates in-line with Public Health England/UK Health Security Agency recommendations.
- Immunisation schedule p. 876: updated guidance in-line with UK Health Security Agency recommendations.
- Immunisation schedule p. 876: updated National flu immunisation programme in-line with Public Health England recommendations.
- Immunoglobulins p. 865: updated guidance in-line with Public Health England recommendations for the use of immunoglobulin for tetanus infection and prophylaxis.
- Influenza vaccine p. 884: updated guidance in-line with Public Health England recommendations.
- Influenza vaccine p. 884: updated guidance in-line with UK Health Security Agency recommendations.
- Ivacaftor p. 203: Ivacaftor, tezacaftor, elexacaftor (*Kaftrio*® ▼) in combination with ivacaftor (*Kalydeco*®): risk of serious liver injury; updated advice on liver function testing [MHRA/CHM advice].
- Levetiracetam p. 227: addition of dosing for convulsive status epilepticus in children.
- Levothyroxine sodium p. 551: new prescribing advice for patients who experience symptoms on switching between different levothyroxine products [MHRA/CHM advice].
- Malaria, prophylaxis p. 442: updated guidance in-line with Public Health England recommendations.
- Metformin hydrochloride p. 519: study shows no safety concerns in pregnancy [MHRA/CHM advice].
- Miconazole p. 803: oral gel no longer licensed for treatment of intestinal candidiasis.
- Migraine p. 322: updated guidance on preventative migraine treatment.
- Nausea and labyrinth disorders p. 289: updated guidance on the management of nausea and vomiting during pregnancy.
- Neonatal infection, antibacterial therapy p. 344: new guidance on management.
- Oral anticoagulants p. 97: updated guidance in overview.

- Oral retinoid medicines: temporary monitoring advice during coronavirus (COVID-19) pandemic [MHRA/CHM advice] (advice in acitretin, isotretinoin; see example in isotretinoin p. 852).
- Paediatric Steroid Treatment Card to support early recognition and treatment of adrenal crisis in children with adrenal insufficiency [British Society for Paediatric Endocrinology and Diabetes] (advice for alclometasone dipropionate; beclometasone dipropionate; benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide; betamethasone; budesonide; ciclesonide; cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate; cinchocaine with hydrocortisone; cinchocaine with prednisolone; ciprofloxacin with fluocinolone acetonide; clobetasol propionate; clobetasone butyrate; deflazacort; dexamethasone; diflucortolone valerate; fludrocortisone acetate; fludroxycortide; flumetasone pivalate with clioquinol; fluocinolone acetonide; fluocinonide; fluorometholone; fluticasone; gentamicin with hydrocortisone; hydrocortisone; hydrocortisone butyrate; hydrocortisone with lidocaine; methylprednisolone; mometasone furoate; prednisolone; triamcinolone acetonide; triamcinolone hexacetonide; see Corticosteroids (systemic) p. 502).
- Pain, chronic p. 300: new guidance for management in children.
- Phenobarbital p. 243: updated information on the available oral solutions and advice from the RCPCH/NPPG can be found in the prescribing and dispensing section of the Phenobarbital monograph.
- Phosphate imbalance p. 683: updated guidance on the use of phosphate-binding agents.
- Potassium permanganate p. 856: inadvertent oral administration of potassium permanganate [National Patient Safety Alert advice].
- Prescribing in renal impairment p. 15: updated guidance.
- Rabies vaccine p. 890: addition of new guidance for post-exposure management.
- Remdesivir p. 458: reporting to the UK COVID-19 Antivirals Pregnancy Registry [MHRA/CHM advice].
- Remdesivir p. 458: update to treatment duration.
- Rosacea and Acne: title changed to Rosacea p. 849.
- Skin infections, antibacterial therapy p. 348: new guidance for the management of secondary bacterial infection of common skin conditions.
- Smoking cessation p. 330: updated guidance on management.
- Tetanus vaccine p. 892: updated guidance in-line with Public Health England recommendations.
- Tofacitinib p. 732 (*Xeljanz*®): new measures to minimise risk of major adverse cardiovascular events and malignancies [MHRA/CHM advice].
- Topical corticosteroids: information on the risk of topical steroid withdrawal reactions [MHRA/CHM advice] (advice for alclometasone dipropionate; beclometasone dipropionate; benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide; betamethasone; cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate; cinchocaine with hydrocortisone; cinchocaine with prednisolone; clobetasol propionate; diflucortolone valerate; fludroxycortide; fluocinolone acetonide; fluticasone; hydrocortisone; hydrocortisone with lidocaine; Corticosteroids (topical) p. 825).
- Trientine dihydrochloride: name change to Trientine p. 705, and update to dosing for Wilson's disease.
- Type 1 diabetes p. 512: updated guidance on Recommended insulin regimens.
- Varicella-zoster vaccine: title changed to Varicella-zoster vaccines p. 894.
- Vitamins p. 712: addition of new guidance for vitamin D.
- Yellow fever vaccine, live p. 912 (*Stamaril*®): new pre-vaccination checklist [MHRA/CHM advice].

Dose changes

Changes in dose statements that appear in the print edition of BNF for Children 2022 — 2023:

- Adrenaline/epinephrine p. 149 [update to dosing for acute anaphylaxis].
- Adrenaline/epinephrine p. 149 [update to dosing for emergency treatment of acute anaphylaxis].
- Chloral hydrate p. 327 [update to dosing information for short-term treatment of severe insomnia].
- COVID-19 vaccine p. 903 [update to dosing for immunisation against COVID-19].
- Dexamethasone p. 504 [update to dosing for COVID-19 requiring supplemental oxygen].
- Dolutegravir p. 471 [update to dosing for the treatment of HIV infection].
- Eculizumab p. 647 [update to children's dosing].
- Eltrombopag p. 664 [addition of Southeast Asian ethnicity to dosing for treatment of chronic idiopathic thrombocytopenic purpura].
- Erythromycin p. 378 [amended age range for otitis media and sore throat in children].
- Etanercept p. 736 [update to dosing].
- Etravirine p. 474 [update to age and weight range for HIV infection].
- Heparin (unfractionated) p. 105 [dose statement for maintenance of neonatal umbilical arterial catheter amended to reflect use in practice (route removed)].
- Hepatitis B immunoglobulin p. 868 [update to dosing in prophylaxis against hepatitis B infection from birth to 4 years old, and dosing in prevention of transmitted infection at birth].
- Human papillomavirus vaccines p. 907 [update to indications and dosing].
- Perampanel p. 229 [update to include dosing in children from 4 years old for treatment of focal seizures and from 7 years old for primary generalised tonic-clonic seizures].
- Pyridostigmine bromide p. 741 [update to dosing for myasthenia gravis in neonates and children].
- Remdesivir p. 458 [update to indications and dosing].
- Sapropterin dihydrochloride p. 711 [update to age range for phenylketonuria].
- Valganciclovir p. 468 [removal of dose equivalence statement].
- Vancomycin p. 371 [update to dosing for *Clostridioides difficile* infection].

Classification changes

Classification changes that appear in the print edition of BNF for Children 2022 — 2023:

- Minoxidil p. 129 [primary classification changed to Potassium-channel openers].

New monographs

New monographs that appear in the print edition of BNF for Children 2022 — 2023:

- *Acarizax*® [house dust mite extract p. 197].
- *Adakveo*® [crizanlizumab p. 650].
- *Cibinqo*® [abrocitinib p. 841].
- *Dificlir*® [fidaxomicin p. 409].
- *Evrysdi*® [risdiplam p. 739].
- *Fintepla*® [fenfluramine p. 221].
- *Givlaari*® [givosiran p. 689].
- *Keytruda*® [pembrolizumab p. 602].
- *Koselugo*® [selumetinib p. 640].
- Liraglutide p. 520.
- *Orladeyo*® [berotralstat p. 200].
- *Pradaxa*® [dabigatran etexilate p. 107].
- *Rinvoq*® [upadacitinib p. 842].
- *Ruconest*® [conestat alfa p. 199].

- *Ryaltris*® [mometasone furoate with olopatadine p. 794].
- *Taltz*® [ixekizumab p. 840].
- *Ultomiris*® [ravulizumab p. 648].
- *Xarelto*® [rivaroxaban p. 100].
- *Xeljanz*® [tofacitinib p. 732].
- *Xevudy*® [sotrovimab p. 458].
- *Xofluza*® [baloxavir marboxil p. 489].

New preparations

New preparations that appear in the print edition of BNF for Children 2022 — 2023:

- *Fixkoh Airmaster*® [fluticasone with salmeterol p. 177].
- *Kigabeq*® [vigabatrin p. 241].
- *Vaxelis*® [diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 898].

Deleted monographs

Deleted monographs since the print edition of BNF for Children 2021 — 2022:

- Emollient bath and shower products, tar-containing.
- Meningococcal group C vaccine.
- Tetrahydrobiopterin.
- Tinidazole.

Deleted preparations

Deleted preparations since the print edition of BNF for Children 2021 — 2022:

- *Cervarix*® [human papillomavirus vaccines p. 907].
- *Synflorix*® [pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 901].
- *Tacni*® [tacrolimus p. 591].

Guidance on prescribing

General guidance

Medicines should be given to children only when they are necessary, and in all cases the potential benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered.

It is important to discuss treatment options carefully with the child and the child's carer. In particular, the child and the child's carer should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, this should be highlighted.

For guidance on medicines optimisation, see Medicines optimisation p. 23.

Never Events Never events are serious and avoidable medical errors for which there should be preventative measures in place to stop their occurrence.

The NHS Never Events policy and framework can be viewed at: www.england.nhs.uk/publication/never-events/.

For never events related to single drugs or drug classes, BNF Publications contain information within the monographs, in the important safety information section.

Prescribing competency framework The Royal Pharmaceutical Society has published a Prescribing Competency Framework that includes a common set of competencies that form the basis for prescribing, regardless of professional background. The competencies have been developed to help healthcare professionals be safe and effective prescribers with the aim of supporting patients to get the best outcomes from their medicines. It is available at www.rpharms.com/resources/frameworks/prescribers-competency-framework.

Transitional services for chronic conditions

The process of moving from paediatric to adult services can lead to a loss of continuity in care and provoke anxiety in children and their carers. EvGr Practitioners should start planning for adult care when the child reaches the age of 13 or 14 at the latest and a child-centred approach should be taken. Consider designating a named practitioner among those providing care to the child to take a coordinating role and to act as an advocate for the child, maintaining a link between the various practitioners involved in care (including a named GP). A

Drug treatment in children

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care; the risk of toxicity is increased by a reduced rate of drug clearance and differing target organ sensitivity. The terms infant, child and adolescent are used inconsistently in the literature. However, **for reference purposes only**, the terms generally used to describe the paediatric stages of development are:

Preterm neonate	Born at < 37 weeks gestation
Term neonate	Born at 37 to 42 weeks gestation
Post-term neonate	Born at ≥42 weeks gestation
Neonate	From 0 up to 28 days of age (or first 4 weeks of life)
Infant	From 28 days up to 24 months of age
Child	From 2 years up to 12 years of age
Adolescent	From 12 years up to 18 years of age

In BNF for Children, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

Administration of medicines to children

Children should be involved in decisions about taking medicines and encouraged to take responsibility for using them correctly. The degree of such involvement will depend on the child's age, understanding, and personal circumstances.

Occasionally a medicine or its taste has to be disguised or masked with small quantities of food. However, unless specifically permitted (e.g. some formulations of pancreatin p. 54), a medicine should **not** be mixed with large quantities of food because the full dose might not be taken and the child might develop an aversion to food if the medicine imparts an unpleasant taste. Medicines should not be mixed or administered in a baby's feeding bottle.

Children under 5 years (and some older children) find a liquid formulation more acceptable than tablets or capsules. However, for long-term treatment it may be possible for a child to be taught to take tablets or capsules.

An oral syringe should be used for accurate measurement and controlled administration of an oral liquid medicine. The unpleasant taste of an oral liquid can be disguised by flavouring it or by giving a favourite food or drink immediately afterwards, but the potential for food-drug interactions should be considered.

Advice should be given on dental hygiene to those receiving medicines containing cariogenic sugars for long-term treatment; sugar-free medicines should be provided whenever possible.

Children with nasal feeding tubes in place for prolonged periods should be encouraged to take medicines by mouth if possible; enteric feeding should generally be interrupted before the medicine is given (particularly if enteral feeds reduce the absorption of a particular drug). Oral liquids can be given through the tube provided that precautions are taken to guard against blockage; the dose should be washed down with warm water. When a medicine is given through a nasogastric tube to a neonate, **sterile water** must be used to accompany the medicine or to wash it down.

The intravenous route is generally chosen when a medicine cannot be given by mouth; reliable access, often a central vein, should be used for children whose treatment involves irritant or inotropic drugs or who need to receive the medicine over a long period or for home therapy. The subcutaneous route is used most commonly for insulin administration. Intramuscular injections should preferably be **avoided** in children, particularly neonates, infants, and young children. However, the intramuscular route may be advantageous for administration of single doses of medicines when intravenous cannulation would be more problematic or painful to the child. Certain drugs, e.g. some vaccines, are only administered intramuscularly.

The intrathecal, epidural and intraosseous routes should be used **only** by staff specially trained to administer medicines by these routes. Local protocols for the management of intrathecal injections must be in place.

Managing medicines in school

Administration of a medicine during schooltime should be avoided if possible; medicines should be prescribed for once

or twice-daily administration whenever practicable. If the medicine needs to be taken in school, this should be discussed with parents or carers and the necessary arrangements made in advance; where appropriate, involvement of a school nurse should be sought. *Managing Medicines in Schools and Early Years Settings* produced by the Department of Health and Social Care provides guidance on using medicines in schools (www.gov.uk/government/organisations/department-of-health-and-social-care).

Patient information leaflets

Manufacturers' patient information leaflets that accompany a medicine, cover only the licensed use of the medicine. Therefore, when a medicine is used outside its licence, it may be appropriate to advise the child and the child's parent or carer that some of the information in the leaflet might not apply to the child's treatment. Where necessary, inappropriate advice in the patient information leaflet should be identified and reassurance provided about the correct use in the context of the child's condition.

Biological medicines

Biological medicines are medicines that are made by or derived from a biological source using biotechnology processes, such as recombinant DNA technology. The size and complexity of biological medicines, as well as the way they are produced, may result in a degree of natural variability in molecules of the same active substance, particularly in different batches of the medicine. This variation is maintained within strict acceptable limits. Examples of biological medicines include insulins and monoclonal antibodies. EvGr Biological medicines must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines. A

Biosimilar medicines

A **biosimilar medicine** is a biological medicine that is highly similar and clinically equivalent (in terms of quality, safety, and efficacy) to an existing biological medicine that has already been authorised in the European Union (known as the reference biological medicine or originator medicine). The active substance of a biosimilar medicine is similar, but not identical, to the originator biological medicine. Once the patent for a biological medicine has expired, a biosimilar medicine may be authorised by the European Medicines Agency (EMA). A biosimilar medicine is not the same as a generic medicine, which contains a simpler molecular structure that is identical to the originator medicine.

Therapeutic equivalence EvGr Biosimilar medicines should be considered to be therapeutically equivalent to the originator biological medicine within their authorised indications. A Biosimilar medicines are usually licensed for all the indications of the originator biological medicine, but this depends on the evidence submitted to the EMA for authorisation and must be scientifically justified on the basis of demonstrated or extrapolated equivalence.

Prescribing and dispensing The choice of whether to prescribe a biosimilar medicine or the originator biological medicine rests with the clinician in consultation with the patient. EvGr Biological medicines (including biosimilar medicines) must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines. A

Safety monitoring Biosimilar medicines are subject to a black triangle status (▼) at the time of initial authorisation. EvGr It is important to report suspected adverse reactions using the Yellow Card Scheme (see Adverse reactions to drugs p. 11). For all biological medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine. A

UK Medicines Information centres have developed a validated tool to determine potential safety issues associated with all new medicines. These 'in-use product safety assessment reports' will be published for new biosimilar medicines as they become available, see www.sps.nhs.uk/home/medicines/.

National funding/access decisions The Department of Health has confirmed that, in England, NICE can decide to apply the same remit, and the resulting technology appraisal guidance, to relevant biosimilar medicines which appear on the market subsequent to their originator biological medicine. In other circumstances, where a review of the evidence for a particular biosimilar medicine is necessary, NICE will consider producing an evidence summary (see *Evidence summary: new medicines*, www.nice.org.uk/about/what-we-do/our-programmes/nice-advice/evidence-summaries-new-medicines).

National information In England, see www.nice.org.uk/news/article/evaluating-biosimilar-medicines.

In Northern Ireland, see niformulary.hscni.net/managed-entry/biosimilars/.

In Scotland, see www.scottishmedicines.org.uk/About_SMC/Policy_statements/Biosimilar_Medicines.

In Wales, see awttc.nhs.wales/accessing-medicines/make-a-submission/pharmaceutical-industry-submissions/submit-for-awmsg-appraisal/invisible/appraisal-of-biosimilar-medicines-cell-therapies-and-gene-therapies/.

Availability The following drugs are available as a biosimilar medicine:

- Adalimumab p. 734
- Enoxaparin sodium p. 104
- Epoetin alfa p. 645
- Epoetin zeta p. 647
- Etanercept p. 736
- Filgrastim p. 660
- Infliximab p. 35
- Insulin glargine p. 528
- Insulin lispro p. 525
- Rituximab p. 604
- Somatropin p. 539

Complementary and alternative medicine

An increasing amount of information on complementary and alternative medicine is becoming available. Where appropriate, the child and the child's carers should be asked about the use of their medicines, including dietary supplements and topical products. The scope of BNF for Children is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John's wort). Further information on herbal medicines is available at www.gov.uk/government/organisations/medicines-and-healthcare-products-regulatory-agency.

BNF for Children and marketing authorisation

Where appropriate the *doses, indications, cautions, contra-indications,* and *side-effects* in BNF for Children reflect those in the manufacturers' Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). BNF for Children does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, BNF for Children reflects advice that is

the most clinically relevant regardless of any variation in the marketing authorisation. Unlicensed products can be obtained from 'special-order' manufacturers or specialist importing companies.

As far as possible, medicines should be prescribed within the terms of the marketing authorisation. However, many children require medicines not specifically licensed for paediatric use. Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 do not prohibit the use of unlicensed medicines.

BNF for Children includes advice involving the use of unlicensed medicines or of licensed medicines for unlicensed uses ('off-label' use). Such advice reflects careful consideration of the options available to manage a given condition and the weight of evidence and experience of the unlicensed intervention, and limitations of the marketing authorisation should not preclude unlicensed use where clinically appropriate. Where an unlicensed drug or 'off-label' use is included, this is indicated in the unlicensed use section of the drug monograph.

Prescribing unlicensed medicines Prescribing unlicensed medicines or medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber's professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient's carer that the prescribed medicine is unlicensed.

Drugs and driving

Prescribers and other healthcare professionals should advise children and their carers if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.gov.uk/government/organisations/driver-and-vehicle-licensing-agency.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including amfetamines, cannabis, cocaine, and ketamine p. 931, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride. However, the legislation provides a statutory "medical defence" for patients taking drugs for medical reasons in accordance with instructions, *if their driving was not impaired*—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine's patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

Oral syringes

An **oral syringe** is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5-mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5-*mL spoon* is used for doses of 5 mL (or multiples thereof).

Excipients

Branded oral liquid preparations that do not contain *fructose, glucose,* or *sucrose* are described as 'sugar-free' in BNF for Children. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked 'sugar-free' since they do not cause dental caries. Children receiving medicines containing cariogenic sugars, or their carers, should be advised of dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible, particularly if treatment is required for a long period.

Where information on the presence of *ethanol (alcohol), aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil* or *sesame oil* is available, this is indicated in BNF for Children against the relevant preparation.

Information is provided on *selected excipients* in skin preparations, in vaccines, and on *selected preservatives* and *excipients* in eye drops and injections.

The presence of *benzyl alcohol* and *polyoxyl castor oil* (polyethoxylated castor oil) in injections is indicated in BNF for Children. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of *propylene glycol* in oral or parenteral medicines is indicated in BNF for Children; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with metronidazole p. 381.

The *lactose* content in most medicines is too small to cause problems in most lactose-intolerant children. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

The Neonatal & Paediatric Pharmacists Group has produced a position statement on how to choose a suitable oral liquid medicine for a child. This statement, which has been endorsed by the Royal College of Paediatrics and Child Health, includes practical advice on assessing excipient content, in addition to other key considerations. For further information, see: nppg.org.uk/choosing-an-oral-liquid-for-a-child/

Electrolytes

The *sodium* content of medicines should be considered for all patients, especially those with cardiovascular disease or on a reduced sodium diet, or those requiring long-term or regular medication.

Some formulations of medicines, especially those that are effervescent, dispersible or soluble, can contain high levels of sodium as an excipient and this may be associated with an increased risk of cardiovascular events, including hypertension.

The sodium content of a medicine is provided in the product literature for all medicines containing $\geq$ 1 mmol sodium per dose; below this level is considered essentially sodium-free. Medicines containing $\geq$ 17 mmol sodium in the total daily dose are considered to have a high sodium content and this is highlighted for medicines intended to be taken regularly (repeated use for more than 2 days every week) or long-term (continuous daily use for more than 1 month). 17 mmol sodium is approximately 20% of the

WHO recommended maximum daily dietary intake of sodium for an adult.

Important In the absence of information on excipients or electrolytes in BNF for Children and in the product literature (available at www.medicines.org.uk/emc/), contact the manufacturer if it is essential to check details.

Health and safety

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Care is required to avoid sources of heat (including hair dryers) when flammable substances are used on the skin or hair. Substances, such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution; contact with the skin and inhalation of dust should be avoided. Healthcare professionals and carers should guard against exposure to sensitising, toxic or irritant substances if it is necessary to crush tablets or open capsules.

EEA and Swiss prescriptions

Pharmacists can dispense prescriptions issued by doctors, dentists, and nurse prescribers from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor, dentist, or nurse, and should be signed by the prescriber.

Security and validity of prescriptions

The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions.

In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible;
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific child. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit the child's care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

NICE, Scottish Medicines Consortium and All Wales Medicines Strategy Group

Advice issued by the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC) and the All Wales Medicines Strategy Group (AWMSG) is referenced in BNF for Children when relevant. Full details of this advice together with updates can be obtained from the funding body websites: www.nice.org.uk, www.scottishmedicines.org.uk and awttc.nhs.wales/.

Specialised commissioning decisions

NHS England develops specialised commissioning policies that define access to specialised services for particular groups of patients to ensure consistency in access to treatments nationwide. For further information, see www.england.nhs.uk/specialised-commissioning-document-library/routinely-commissioned-policies/.

NHS England also commissions treatments for patients aged less than 18 years where specific commissioning conditions within a NICE Technology Appraisal or NHS England policy are met, see www.england.nhs.uk/publication/commissioning-medicines-for-children-specialised-services/.

Prescription writing

Shared care

In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Requirements

Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for **prescription-only medicines**. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m^2 body-surface area e.g. mg/m^2 where this would reduce error.

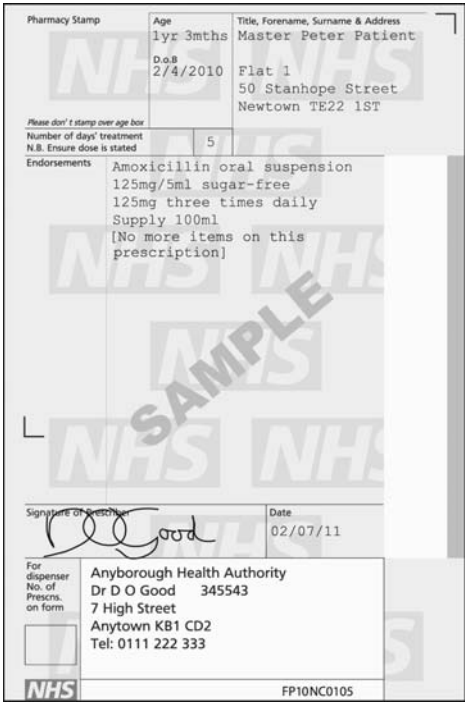
The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- Quantities of 1 gram or more should be written as 1 g, 1.5 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other

figure, e.g. 0.5 mL, not.5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.

- 'Micrograms' and 'nanograms' should **not** be abbreviated. Similarly 'units' should **not** be abbreviated.
- The term 'millilitre' (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm^3 should not be used. (The use of capital 'L' in mL is a printing convention throughout the BNF; both 'mL' and 'ml' are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken 'as required' a **minimum dose interval** should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. '125 mg 3 times daily'); terms such as '5 mL' or '1 tablet' should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for *oral liquid preparations* the dose-volume will be provided by means of an **oral syringe**, (except for preparations intended to be measured with a pipette). Suitable quantities:
  - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
  - Adult Mixtures (10 mL dose), 200 or 300 mL
  - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer's pack)
  - Eye Lotions, Gargles, and Mouthwashes, 200 mL
- The names of drugs and preparations should be written clearly and **not** abbreviated, using approved titles **only**; **avoid** creating generic titles for modified-release preparations.
- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in **English without abbreviation**, it is recognised that some Latin abbreviations are used.

Sample prescription



Abbreviation of titles In general, titles of drugs and preparations should be written *in full*. Unofficial abbreviations should **not** be used as they may be misinterpreted.

Non-proprietary titles Where non-proprietary ('generic') titles are given, they should be used for prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer's version of the formulation, making it important that the child should always receive the same brand; in such cases, the brand name or the manufacturer should be stated.

Non-proprietary names of compound preparations Non-proprietary names of **compound preparations** which appear in BNF for Children are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients. Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix 'co-' should be retained. Special care should also be taken to avoid creating generic names for **modified-release** preparations where the use of these names could lead to confusion between formulations with different duration of action.

Supply of medicines

Overview

When supplying a medicine for a child, the pharmacist should ensure that the child and the child's carer understand the nature and identity of the medicine and how it should be used. The child and the carer should be provided with appropriate information (e.g. how long the medicine should be taken for and what to do if a dose is missed or the child vomits soon after the dose is given).

Safety in the home

Carers and relatives of children must be warned to keep all medicines out of the reach and sight of children. Tablets, capsules and oral and external liquid preparations must be dispensed in a reclosable *child-resistant container* unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the child's carer will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of *unwanted medicines* by returning them to a pharmacy for destruction.

Labelling of prescribed medicines

There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the supplying pharmacy;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words 'Keep out of the sight and reach of children';
- where applicable, the words 'Use this medicine only on your skin'.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Unlicensed medicines

A drug or formulation that is not covered by a marketing authorisation may be obtained from a pharmaceutical company, imported by a specialist importer, manufactured by a commercial or hospital licensed manufacturing unit, or prepared extemporaneously against a prescription.

The safeguards that apply to products with marketing authorisation should be extended, as far as possible, to the use of unlicensed medicines. The safety, efficacy, and quality (including labelling) of unlicensed medicines should be assured by means of clear policies on their prescribing, purchase, supply, and administration. Extra care is required with unlicensed medicines because less information may be available on the drug and any formulation of the drug.

The following should be agreed with the supplier when ordering an unlicensed or extemporaneously prepared medicine:

- the specification of the formulation;
- documentation confirming the specification and quality of the product supplied (e.g. a certificate of conformity or of analysis);
- for imported preparations product and licensing information should be supplied in English.

Extemporaneous preparations

A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. Every effort should be made to ensure that an extemporaneously prepared product is stable and that it delivers the requisite dose reliably; the child should be provided with a consistent formulation regardless of where the medicine is supplied to minimise variations in quality. Where there is doubt about the formulation, advice should be sought from a medicines information centre, the pharmacy at a children's hospital, a hospital production unit, a hospital quality control department, or the manufacturer.

In many cases it is preferable to give a licensed product by an unlicensed route (e.g. an injection solution given by mouth) than to prepare a special formulation. When tablets or capsules are cut, dispersed, or used for preparing liquids immediately before administration, it is important to confirm uniform dispersal of the active ingredient, especially if only a portion of the solid content (e.g. a tablet segment) is used or if only an aliquot of the liquid is to be administered.

In some cases the child's clinical condition may require a dose to be administered in the absence of full information on the method of administration. It is important to ensure that the appropriate supporting information is available at the earliest opportunity.

Preparation of products that produce harmful dust (e.g. cytotoxic drugs, hormones, or potentially sensitising drugs such as neomycin sulfate p. 815) should be **avoided** or undertaken with appropriate precautions to protect staff and carers.

The BP direction that a preparation must be *freshly prepared* indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be *recently prepared* indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term **water** used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation.

Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   i) that there is immediate need for the prescription-only medicine and that it is impracticable in the

circumstances to obtain a prescription without undue delay;
ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
iii) as to the dose that it would be appropriate for the person to take;

b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital p. 243, *phenobarbital sodium*, or Controlled Drugs in Schedules 4 or 5 (doctors, dentists, or nurse prescribers from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:
i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
ii) an oral contraceptive when a full cycle may be supplied;
iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;

c) that an entry shall be made by the pharmacist in the prescription book stating:
i) the date of supply;
ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
iii) the name and address of the patient;
iv) the nature of the emergency;

d) that the container or package must be labelled to show:
i) the date of supply;
ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
iii) the name of the patient;
iv) the name and address of the pharmacy;
v) the words 'Emergency supply';
vi) the words 'Keep out of the reach of children' (or similar warning);

e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 243 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice,* London, Pharmaceutical Press (always consult latest edition). Doctors, dentists, or nurse prescribers from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation.

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, physiotherapist, therapeutic radiographer, optometrist, podiatrist or paramedic independent prescriber; or a doctor, dentist, or nurse prescriber from the European Economic Area or Switzerland, provided:

a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
b) that the prescriber has undertaken to furnish a prescription within 72 hours;
c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 243 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice,* London, Pharmaceutical Press (always consult latest edition); (Doctors, dentists, or nurse prescribers from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).
e) that an entry shall be made in the prescription book stating:
i) the date of supply;
ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
iii) the name and address of the practitioner requesting the emergency supply;
iv) the name and address of the patient;
v) the date on the prescription;
vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society's guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, London Pharmaceutical Press, (always consult latest edition).

Controlled drugs and drug dependence

Regulations and classification

The Misuse of Drugs Act, 1971 as amended prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession (except where permitted by the 2001 Regulations or under licence from the Secretary of State). The penalties applicable to offences involving the different drugs are graded broadly according to the *harmfulness attributable to a drug when it is misused* and for this purpose the drugs are defined in the following three classes:

- **Class A** includes: alfentanil p. 929, cocaine, diamorphine hydrochloride p. 309 (heroin), dipipanone hydrochloride, fentanyl p. 311, lysergide (LSD), methadone hydrochloride p. 333, 3, 4-methylenedioxymethamfetamine (MDMA, 'ecstasy'), morphine p. 315, opium, oxycodone hydrochloride p. 317, pethidine hydrochloride p. 319, phencyclidine, remifentanil p. 930, and class B substances when prepared for injection.
- **Class B** includes: oral amfetamines, barbiturates, cannabis, *Sativex*®, codeine phosphate p. 308, dihydrocodeine tartrate p. 310, ethylmorphine,

glutethimide, ketamine p. 931, nabilone p. 291, pentazocine, phenmetrazine, and pholcodine p. 208.

- **Class C** includes: certain drugs related to the amfetamines such as benzfetamine and chlorphentermine, buprenorphine p. 306, mazindol, meprobamate, pemoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 320, zaleplon, zolpidem tartrate, zopiclone, androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, somatropin p. 539, gabapentin p. 223, and pregabalin.

The Misuse of Drugs (Safe Custody) Regulations 1973 as amended details the storage and safe custody requirements for Controlled Drugs.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) defines the classes of person who are authorised to supply and possess Controlled Drugs while acting in their professional capacities and lays down the conditions under which these activities may be carried out. In the 2001 regulations, drugs are divided into five Schedules, each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

- **Schedule 1** includes drugs not used medicinally such as hallucinogenic drugs (e.g. LSD), ecstasy-type substances, raw opium, and cannabis. A Home Office licence is generally required for their production, possession, or supply. A Controlled Drug register must be used to record details of any Schedule 1 Controlled Drugs received or supplied by a pharmacy.
- **Schedule 2** includes opiates (e.g. diamorphine hydrochloride p. 309 (heroin), morphine p. 315, methadone hydrochloride p. 333, oxycodone hydrochloride p. 317, pethidine hydrochloride p. 319), major stimulants (e.g. amfetamines), quinalbarbitone (secobarbital), cocaine, ketamine p. 931, and cannabis-based products for medicinal use in humans. Schedule 2 Controlled Drugs are subject to the full Controlled Drug requirements relating to prescriptions, safe custody (except for quinalbarbitone (secobarbital) and some liquid preparations), and the need to keep a Controlled Drug register, (unless exempted in Schedule 5). Possession, supply and procurement is authorised for pharmacists and other classes of persons named in the 2001 Regulations.
- **Schedule 3** includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine p. 306, gabapentin p. 223, mazindol, meprobamate, midazolam p. 251, pentazocine, phentermine, pregabalin, temazepam p. 932, and tramadol hydrochloride p. 320. They are subject to the special prescription requirements. Safe custody requirements do apply, except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), gabapentin p. 223, mazindol, meprobamate, midazolam p. 251, pentazocine, phentermine, pregabalin, tramadol hydrochloride p. 320, or any stereoisomeric form or salts of the above. Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).
- **Schedule 4** includes in Part I drugs that are subject to minimal control, such as benzodiazepines (except temazepam p. 932 and midazolam p. 251, which are in Schedule 3), non-benzodiazepine hypnotics (zaleplon, zolpidem tartrate, and zopiclone) and *Sativex*®. Part II includes androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin p. 539. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements. Records in registers do not need to be kept (except in the case of *Sativex*®).
- **Schedule 5** includes preparations of certain Controlled Drugs (such as codeine, pholcodine p. 208 or morphine p. 315) which due to their low strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Since the Responsible Pharmacist Regulations were published in 2008, standing operation procedures for the management of Controlled Drugs, are required in registered pharmacies.

The Health Act 2006 introduced the concept of the 'accountable officer' with responsibility for the management of Controlled Drugs and related governance issues in their organisation. Most recently, in 2013 The Controlled Drugs (Supervision of Management and Use) Regulations were published to ensure good governance concerning the safe management and use of Controlled Drugs in England and Scotland.

Prescriptions

Preparations in Schedules 1, 2, 3, 4 and 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF for Children using the following symbols:

CD1	for preparations in Schedule 1
CD2	for preparations in Schedule 2
CD3	for preparations in Schedule 3
CD4–1	for preparations in Schedule 4 (Part I)
CD4–2	for preparations in Schedule 4 (Part II)
CD5	for preparations in Schedule 5

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance at www.gov.uk/dh).

Prescription requirements Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible, must be *signed* by the prescriber, include the *date* on which they were signed, and specify the prescriber's *address* (must be within the UK). A machine-written prescription is acceptable, but the prescriber's signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions for Controlled Drugs that are subject to the prescription requirements must always state:

- the name and address of the patient (use of a PO Box is not acceptable);
- in the case of a preparation, the form (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. *MST Continus*, or whether only one form is available), and, where appropriate, the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified); to avoid ambiguity, where a prescription requests multiple strengths of a medicine, each strength should be prescribed separately (i.e. separate dose, total quantity, etc);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units (tablets, capsules, ampoules), state the total number (in both words and figures) of dosage units to be supplied (e.g. 10 tablets [of 10 mg] rather than 100 mg total quantity);

- the dose, which must be clearly defined (i.e. the instruction 'one as directed' constitutes a dose but 'as directed' does not); it is not necessary that the dose is stated in both words and figures;
- the words 'for dental treatment only' if issued by a dentist.

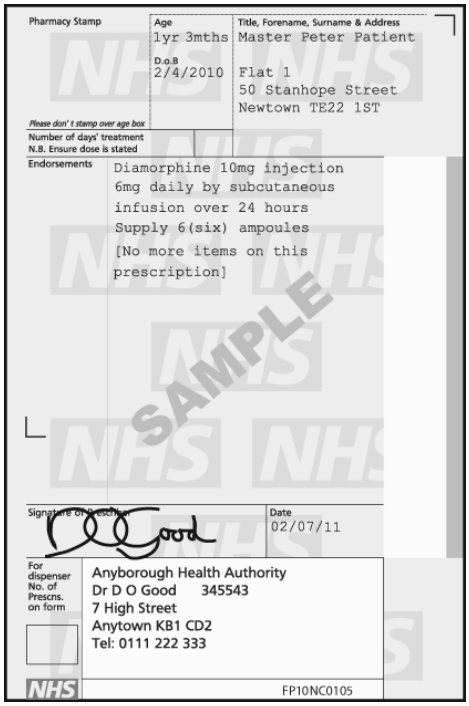
A pharmacist is **not** allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription *if* it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (e.g. name, date, signature and GPhC registration number). The prescription should be marked with the date of supply at the time the Controlled Drug supply is made.

The Department of Health and the Scottish Government have issued a strong recommendation that the maximum quantity of Schedule 2, 3 or 4 Controlled Drugs prescribed should not exceed 30 days; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient's notes.

A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription). Schedule 5 prescriptions are valid for 6 months from the appropriate date.

Medicines that are not Controlled Drugs should not be prescribed on the same form as a Schedule 2 or 3 Controlled Drug.

See sample prescription:



Instalments and repeatable prescriptions Prescriptions for Schedule 2 or 3 Controlled Drugs can be dispensed by instalments. An instalment prescription must have an instalment direction including both the dose and the instalment amount specified separately on the prescription, and it must also state the interval between each time the medicine can be supplied.

The first instalment must be dispensed within 28 days of the appropriate day (i.e. date of signing unless the prescriber indicates a date before which the Controlled Drug should not be dispensed) and the remainder should be dispensed in accordance with the instructions on the prescription. The prescription must be marked with the date of each supply.

The instalment direction is a legal requirement and needs to be complied with, however, for certain situations (e.g. if a pharmacy is closed on the day an instalment is due) the Home Office has approved specific wording which provides pharmacists some flexibility for supply. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Home Office approved wording for instalment prescribing (Circular 027/2015), available at www.gov.uk/.

Repeatable prescriptions are prescriptions which contain a direction that they can be dispensed more than once (e.g. repeat × 3). Only Schedule 4 and 5 Controlled Drugs are permitted on repeatable prescriptions.

Private prescriptions Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms which are provided by local NHS England area teams in England (form FP10PCD), local NHS Health Boards in Scotland (form PPCD) and Wales (form W10PCD); in addition, prescriptions must specify the *prescriber's identification number* (or a NHS prescriber code in Scotland). Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

Dependence and misuse

The most common drugs of addiction are **crack cocaine** and **opioids**, particularly **diamorphine hydrochloride p. 309 (heroin)** . For arrangements for prescribing of diamorphine hydrochloride, dipipanone, or cocaine for addicts, see *Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts* below.

Along with traditional stimulants, such as amfetamine and cocaine, there has been an emerging use of methamphetamine and a range of psychoactive substances with stimulant, depressant or hallucinogenic properties such as lysergide (lysergic acid diethylamide, LSD), ketamine or gamma-hydroxybutyrate (sodium oxybate, GHB).

Benzodiazepines and z-drugs (i.e. zopiclone, zolpidem tartrate) have their own potential for misuse and dependence and are often taken in combination with opiates or stimulants.

Cannabis-based products for medicinal use are Schedule 2 Controlled Drugs and can be prescribed only by clinicians listed on the Specialist Register of the General Medical Council. Cannabis with no approved medicinal use is a Schedule 1 Controlled Drug and cannot be prescribed. It remains the most frequently used illicit drug by young people and dependence can develop in around 10% of users. Cannabis use can exacerbate depression and it may cause an acute short-lived toxic psychosis which resolves with cessation, however paranoid symptoms may persist in chronic users; withdrawal symptoms can occur in some users and these can contribute to sleep problems, agitation and risk of self-harm.

Supervised consumption

Supervised consumption is not a legal requirement under the 2001 Regulations. Nevertheless, when supervised consumption is directed on the prescription, the Department of Health recommends that any deviation from the

prescriber's intended method of supply should be documented and the justification for this recorded.

Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment. It is good practice for pharmacists to alert the prescriber when a patient has missed consecutive daily doses.

Prescribing drugs likely to cause dependence or misuse

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

Prescribers are responsible for the security of prescription forms once issued to them. The stealing and misuse of prescription forms could be minimised by the following precautions:

- records of serial numbers received and issued should be retained for at least three years;
- blank prescriptions should never be pre-signed;
- prescription forms should not be left unattended and should be locked in a secure drawer, cupboard, or carrying case when not in use;
- doctors', dentists' and surgery stamps should be kept in a secure location separate from the prescription forms;
- alterations are best avoided but if any are made and the prescription is to be used, best practice is for the prescriber to cross out the error, initial and date the error, then write the correct information;
- if an error made in a prescription cannot be corrected, best practice for the prescriber is to put a line through the script and write 'spoiled' on the form, or destroy the form and start writing a new prescription;
- prescribers and pharmacists dispensing drugs prone to abuse should ensure compliance with all relevant legal requirements specially when dealing with prescriptions for Controlled Drugs (see *Prescription requirements* and *Instalments* above);
- at the time of dispensing, prescriptions should be stamped with the pharmacy stamp and endorsed by the pharmacist or pharmacy technician with what has been supplied; where loss or theft is suspected, the police should be informed immediately.

Travelling abroad

Prescribed drugs listed in Schedule 4 Part II (CD Anab) for self-administration and Schedule 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are not subject to export or import licensing. A personal import/export licence is required for patients travelling abroad with Schedules 2, 3, or 4 Part I (CD Benz) and Part II (CD Anab) Controlled Drugs if, they are carrying more than 3 months' supply or are travelling for 3 calendar months or more. A Home Office licence is required for any amount of a Schedule 1 Controlled Drug imported into the UK for personal use regardless of the duration of travel. Further details can be obtained at www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting DFLU.ie@homeoffice.gsi.gov.uk. In cases of emergency, telephone (020) 7035 6330.

Applications for obtaining a licence must be supported by a cover letter signed by the prescribing doctor or drug worker, which must confirm:

- the patient's name and address;
- the travel itinerary;
- the names of the prescribed Controlled Drug(s), doses and total amounts to be carried.

Applications for licences should be sent to the Home Office, Drugs & Firearms Licensing Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF.

Alternatively, completed application forms can be emailed to DFLU.ie@homeoffice.gsi.gov.uk. A minimum of 10 days should be allowed for processing the application.

Patients travelling for less than 3 months or carrying less than 3 months supply of Controlled Drugs do not require a personal export/import licence, but are advised to carry a cover letter signed by the prescribing doctor or drug worker. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act 2001 and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country's consulate in the UK.

Notification of patients receiving structured drug treatment for substance dependence

In **England**, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.gov.uk/government/collections/alcohol-and-drug-misuse-prevention-and-treatment-guidance.

Enquiries about NDTMS, and how to submit data, should initially be directed to:

- EvidenceApplicationteam@phe.gov.uk

In **Scotland**, doctors should report cases to the Substance Drug Misuse Database. General information about the Scottish Drug Misuse Database can be found in www.isdscotland.org/Health-Topics/Drugs-and-Alcohol-Misuse/Drugs-Misuse/Scottish-Drug-Misuse-Database/. Enquiries about reporting can be directed to:

- nss.isdsubstancemisuse@nhs.net

In **Northern Ireland**, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain Controlled Drugs to the Chief Medical Officer of the Ministry of Health and Social Services. The Northern Ireland contact is:

Public Health Information & Research Branch
Department of Health
Annexe 2
Castle Buildings
Stormont
Belfast
BT4 3SQ
028 9052 2340
phirb@health-ni.gov.uk

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

In **Wales**, doctors should report cases where they are providing structured drug treatment for substance dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substancemisuse-queries@wales.nhs.uk.

Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that **only** medical practitioners who hold a special licence issued by the Home Secretary (or Scottish Government's Chief Medical Officer) may prescribe, administer, or supply diamorphine hydrochloride p. 309, dipipanone, or cocaine for *the treatment of drug addiction*. Medical prescribers, pharmacists independent prescribers, nurses independent prescribers and supplementary prescribers do not require a special licence for prescribing diamorphine hydrochloride p. 309, dipipanone, or cocaine for patients (including addicts) for relieving pain from organic disease or injury.

Adverse reactions to drugs

Yellow card scheme

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below.

Send Yellow Cards to:

FREEPOST YELLOW CARD
(No other address details required).
0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (*self-medication* as well as those *prescribed*), blood products, vaccines, radiographic contrast media, complementary, homeopathic and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal, homeopathic or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:

- **serious, medically significant or result in harm**. Serious events are fatal, life-threatening, a congenital abnormality, disabling or incapacitating, or resulting in hospitalisation;
- associated with **newer drugs and vaccines**; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either 'off-label' or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit's Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

The MHRA's database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

MHRA Drug Safety Update *Drug Safety Update* is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.gov.uk/drug-safety-update.

Self-reporting

Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/yellowcard.

Prescription-event monitoring

In addition to the MHRA's Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit's educational material is available from www.dsru.org.

Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Medication errors

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices

Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF for Children

The BNF for Children includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers' literature may be omitted from the BNF for Children.

Recognising that hypersensitivity reactions (including anaphylactic and anaphylactoid reactions) can occur with virtually all drugs, this effect is not generally listed, unless the drug carries an increased risk of such reactions or specific management advice is provided by the manufacturer. Administration site reactions have been omitted from the BNF for Children (e.g. pain at injection site). The BNF for Children also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes). Drugs that are applied locally or topically carry a theoretical or low risk of systemic absorption and therefore systemic side-effects for these drugs are not listed in the BNF for Children unless they are associated with a high risk to patient safety. Infections are a known complication of treatment with drugs that affect the immune system (e.g. corticosteroids or immunosuppressants); this side-effect is listed in the BNF for Children as 'increased risk of infection'. Symptoms of drug withdrawal reactions are not individually listed, but are collectively termed 'withdrawal syndrome'.

Description of the frequency of side-effects	
Very common	greater than 1 in 10
Common	1 in 100 to 1 in 10
Uncommon [formerly 'less commonly' in BNF publications]	1 in 1000 to 1 in 100
Rare	1 in 10 000 to 1 in 1000
Very rare	less than 1 in 10 000
Frequency not known	frequency is not defined by product literature or the side-effect has been reported from post-marketing surveillance data

The BNF for Children might not use the same wording as manufacturers' literature because, for consistency, the terms used to describe side-effects are standardised using a defined vocabulary across all of the drug monographs in the BNF for Children (e.g. postural hypotension is used for the term orthostatic hypotension). In addition, individual side-effects are often grouped together in the BNF for Children where there are two or more similar side-effects (e.g. hepatitis, hepatic failure, and jaundice are grouped together as 'hepatic disorders').

Some drug monographs in the BNF for Children include information that is common across the drug class. If a side-effect is associated with at least 60% of the drugs in a class

then it will appear as a class side-effect for all drugs in the class, and the frequency of the side-effect will be the highest of all the drugs in that class.

Special problems

Symptoms Children may be poor at expressing the symptoms of an adverse drug reaction and parental opinion may be required.

Delayed drug effects Some reactions (e.g. cancers and effects on development) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the child has had previous reactions to the drug or formulation;
- prescribe as few drugs as possible and give very clear instructions to the child, parent, or carer;
- whenever possible use a familiar drug; with a new drug be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- obtain a full drug history including asking if the child is already taking other drugs *including over-the-counter medicines*; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, particularly in neonates, which can affect the potential for adverse effects. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effects of the drug;
- warn the child, parent, or carer if serious adverse reactions are liable to occur.

Drug allergy (suspected or confirmed)

Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:

- The reaction occurred while the child was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The child has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only gastro-intestinal symptoms present.

The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy:

Immediate, rapidly-evolving reactions (onset usually less than 1 hour after drug exposure)

- Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also Antihistamines, allergen immunotherapy and allergic emergencies p. 186
- Urticaria or angioedema without systemic features
- Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

*Non-immediate reactions, **without** systemic involvement* (onset usually 6–10 days after first drug exposure or 3 days after second exposure)

- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)

*Non-immediate reactions, **with** systemic involvement* (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)

- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythroderma, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthematous pustulosis (AGEP)

EvGr Suspected drug allergy information should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Children and parents or carers should be given information about which drugs and drug-classes to avoid and encouraged to share the drug allergy status.

If a drug allergy is suspected, consider stopping the suspected drug and advising the child and parent or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Children presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Children presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactoid reactions or to determine future treatment options. Children presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient children). A For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) www.nice.org.uk/guidance/cg183.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should **not** be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre

Guidance on intravenous infusions

Intravenous infusions for neonatal intensive care

Intravenous policy A local policy on the dilution of drugs with intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

- Drugs should only be diluted with infusion fluid when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be mixed with an infusion fluid in a syringe and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion syringe should be labelled with the neonate's name and hospital number, the name and quantity of drug, the infusion fluid, and the expiry date and time. If a problem occurs during administration, containers should be retained for a period after use in case they are needed for investigation.
- Administration using a suitable motorised syringe driver is advocated for preparations where strict control over administration is required.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and parenteral nutrition). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin B).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates.

Blood Because of the large number of incompatibilities, drugs should not be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsion These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N*® may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Method

Ready-prepared infusions should be used whenever available. When dilution of drugs is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, further dilution with the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** injection requires dilution in infusions of pH greater than 5.5).

When drug dilutions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed, a concentrated layer of the drug may form owing to differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions; if such a mixture is administered it may have a serious effect on the heart.

A time limit between dilution and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the

formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. sodium nitroprusside.

Drugs given by continuous intravenous infusion to neonates

The information provided in BNF for Children covers dilution with *Glucose intravenous infusion* 5% and 10% and *Sodium chloride intravenous infusion* 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided, therefore care should be taken if water for injections is used.

Prescribing in hepatic impairment

Overview

Children have a large reserve of hepatic metabolic capacity and modification of the choice and dosage of drugs is usually unnecessary even in apparently severe liver disease. However, special consideration is required in the following situations:

- liver failure characterised by severe derangement of liver enzymes and profound jaundice; the use of sedative drugs, opioids, and drugs such as diuretics and amphotericin B p. 430 which produce hypokalaemia may precipitate hepatic encephalopathy;
- impaired coagulation, which can affect response to oral anticoagulants;
- in cholestatic jaundice elimination may be impaired of drugs such as fusidic acid p. 411 and rifampicin p. 419 which are excreted in the bile;
- in hypoproteinaemia, the effect of highly protein-bound drugs such as phenytoin p. 230, prednisolone p. 508, warfarin sodium p. 109, and benzodiazepines may be increased;
- use of hepatotoxic drugs is more likely to cause toxicity in children with liver disease; such drugs should be avoided if possible;
- in neonates, particularly preterm neonates, and also in infants metabolic pathways may differ from older children and adults because liver enzyme pathways may be immature.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in BNF for Children.

Prescribing in renal impairment

Issues encountered in renal impairment

The use of drugs in children with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may produce toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by children with renal impairment;
- some drugs are not effective when renal function is reduced;
- neonates, particularly preterm, may have immature renal function.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.

General Guidance

Drugs eliminated via the kidneys can accumulate during acute kidney injury (AKI) or chronic kidney disease (CKD) and this can lead to further renal impairment or adverse effects. EvGr A review of these drugs is therefore required; any drug which can cause or exacerbate renal impairment should be avoided in AKI, and the appropriateness reviewed in CKD. E

Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in BNF for Children. Dose recommendations are based on the severity of renal impairment.

When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses.

For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentration. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment, it can take many doses at the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same as the initial dose for a child with normal renal function.

For information and advice on the prevention, detection, and management of acute kidney injury, see NICE clinical guideline: **Acute Kidney Injury** (www.nice.org.uk/guidance/ng148).

For further information on acute kidney injury, see Think Kidneys (www.thinkkidneys.nhs.uk/aki/).

Important: dosage adjustment advice in the BNF for Children The information on dose adjustment in BNF for Children may be expressed in terms of estimated glomerular filtration rate (mL/minute/1.73 m^2). However, in product literature, the effects of renal impairment on drug elimination is usually stated in terms of *creatinine clearance* (CrCl). EvGr Although these two measures of renal function are not interchangeable, for most drugs and for most children of average build and height, estimated glomerular filtration rate (using the modified Bedside Schwartz equation) rather than CrCl can be used to determine dosage

adjustments. If clinicians have any concerns, they should discuss with these with their local paediatric nephrology department. Ⓔ

Renal function in adults is routinely reported by clinical laboratories based on estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m^2; however, eGFR is derived from either the Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula or the Modification of Diet in Renal Disease (MDRD) formula which are not validated for use in children. [EvGr] eGFR derived from the CKD-EPI or MDRD formula should **not** be used to adjust drug doses in children with renal impairment. Ⓔ

In BNF for Children, values for measures of renal function are included where possible. However, where such values are not available, the BNF for Children reflects the terms used in the published information.

Estimating renal function

Glomerular filtration rate is low at birth and increases rapidly during the first 6 months. Thereafter, glomerular filtration rate increases gradually to reach adult levels by 1–2 years of age, when standardised to a typical adult body surface area (1.73 m^2). In the first weeks after birth, serum creatinine falls; a single measure of serum creatinine provides only a crude estimate of renal function and observing the change over days is of more use. In the neonate, a sustained rise in serum creatinine or a lack of the expected postnatal decline, is indicative of a reduced glomerular filtration rate.

The serum-creatinine concentration is sometimes used as a measure of renal function but is only a **rough guide** even when corrected for age, weight, and sex.

Estimated glomerular filtration rate [EvGr] Estimated glomerular filtration rate should be used with caution in very malnourished children or those with liver disease. Ⓔ

Modified Bedside Schwartz [EvGr] The following equations are a guide to calculating estimated glomerular filtration rate in children: Ⓔ

Child over 1 month:
Estimated glomerular filtration rate (mL/minute/1.73 m^2)= 35 × height (cm)/serum creatinine (micromol/litre)

Neonate:
Estimated glomerular filtration rate (mL/minute/1.73 m^2)= 30 × height (cm)/serum creatinine (micromol/litre)

The values used in these formulas may differ according to locality or laboratory.

Chronic kidney disease

For guidance on the management of children with, or who are at risk of, chronic kidney disease, see NICE guideline: **Chronic kidney disease: assessment and management** (available at: www.nice.org.uk/guidance/ng203).

Classification of chronic kidney disease using GFR and ACR categories (in adults) Chronic kidney disease **in adults** is classified using a combination of GFR and albumin: creatinine ratio (ACR). A decreased GFR and an increased ACR is associated with an increased risk of adverse outcomes.

For example, an adult with an eGFR of 25 ml/min/1.73 m^2 and an ACR of 15 mg/mmol has a CKD classification of G4A2.

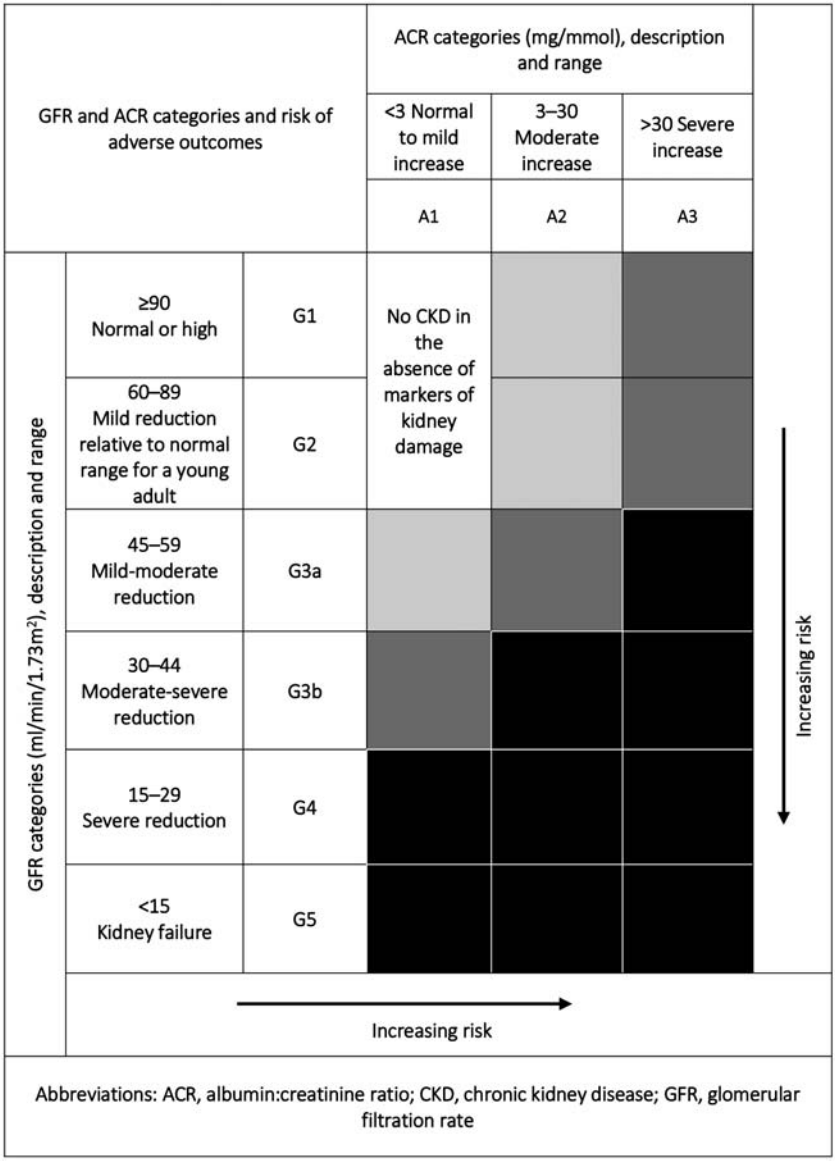
Dialysis

For prescribing in children on renal replacement therapy consult specialist literature.

Advanced Pharmacy Services

Children with renal impairment may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

Classification of chronic kidney disease using GFR and ACR categories (in adults)



Adapted with the kind permission of the Kidney Disease: Improving Global Outcomes (KDIGO) CKD Work Group, 2013.

Prescribing in pregnancy

Overview

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of *childbearing age* or for men *trying* to *father* a child.

During the *first trimester* drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the *second* and *third trimesters* drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The BNF and BNF for Children identify drugs which:

- may have harmful effects in pregnancy and indicate the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from *animal* studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in maternal physiology but this is beyond the scope of the BNF and BNF for Children.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF and BNF for Children.

Important

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service at: www.uktis.org.

MHRA/CHM advice: Medicines in pregnancy and breastfeeding: new initiative for consistent guidance; report on optimising data for medicines used during pregnancy (February 2021)

The Safer Medicines in Pregnancy and Breastfeeding Consortium, formed of the MHRA and partner organisations, aims to improve the health information available to women who are thinking about becoming pregnant, are pregnant, or are breast-feeding, and ensure that they can make informed decisions about their healthcare, particularly about medicines. To support this, healthcare professionals are requested to report inconsistencies in UK advice on the use of individual or classes of medicines during pregnancy or breast-feeding via the consortium at: www.gov.uk/government/publications/safer-medicines-in-pregnancy-and-breastfeeding-consortium.

The Report of the CHM Expert Working Group on Optimising Data on Medicines used During Pregnancy provides recommendations on ways in which data on medicines used during pregnancy and breast-feeding can be better collected and made available for analysis. This will enable more robust evidence to be generated through research and will help to develop clear and consistent advice about medicines used during pregnancy and breast-feeding. The report is available at: www.gov.uk/government/publications/report-of-the-commission-on-human-medicines-expert-working-group-on-optimising-data-on-medicines-used-during-pregnancy.

Prescribing in breast-feeding

Overview

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

Most medicines given to a mother cause no harm to breast-fed infants and there are few contra-indications to breast-feeding when maternal medicines are necessary. However, administration of some drugs to nursing mothers can harm the infant. In the first week of life, some such as preterm or jaundiced infants are at a slightly higher risk of toxicity.

Toxicity to the infant can occur if the drug enters the milk in pharmacologically significant quantities. The concentration in milk of some drugs (e.g. fluvastatin p. 146) may exceed the concentration in maternal plasma so that therapeutic doses in the mother can cause toxicity to the infant. Some drugs inhibit the infant's sucking reflex (e.g. phenobarbital p. 243) while others can affect lactation (e.g. bromocriptine). Drugs in breast milk may, at least theoretically, cause hypersensitivity in the infant even when concentration is too low for a pharmacological effect. BNF for Children identifies drugs:

- which should be used with caution or which are contra-indicated in breast-feeding for the reasons given above;
- which, on present evidence, may be given to the mother during breast-feeding, because they appear in milk in amounts which are too small to be harmful to the infant;
- which are not known to be harmful to the infant although they are present in milk in significant amounts.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF for Children.

Important

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.

MHRA/CHM advice: Medicines in pregnancy and breastfeeding: new initiative for consistent guidance; report on optimising data for medicines used during pregnancy (February 2021)

The Safer Medicines in Pregnancy and Breastfeeding Consortium, formed of the MHRA and partner organisations, aims to improve the health information available to women who are thinking about becoming pregnant, are pregnant, or are breast-feeding, and ensure that they can make informed decisions about their healthcare, particularly about medicines. To support this, healthcare professionals are requested to report inconsistencies in UK advice on the use of individual or classes of medicines during pregnancy or breast-feeding via the consortium at: www.gov.uk/government/publications/safer-medicines-in-pregnancy-and-breastfeeding-consortium.

Prescribing in palliative care

Overview

Palliative care is the active and total approach to the care of children and young adults with life-limiting and life-threatening conditions, embracing physical, emotional, social, and spiritual elements of their care. It focuses on enhancing the quality of life for the child and support for their family, and includes the management of distressing symptoms, provision of respite, and care following death and bereavement.

Effective palliative care requires a broad multidisciplinary approach that includes the whole family, and ideally should start as soon as possible after diagnosis or recognition of a life-threatening condition.

Drug treatment The number of drugs should be as few as possible. Oral medication is usually appropriate unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

For further information on the use of medicines in paediatric palliative care, see the Association for Paediatric Palliative Medicine (APPM) Master Formulary available at www.appm.org.uk/guidelines-resources/appm-master-formulary/.

Pain

Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 302, NSAID), opioid (e.g. codeine phosphate p. 308 'weak', morphine p. 315 'strong') and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate or tramadol hydrochloride p. 320 can be considered for moderate pain. If these preparations do not control the pain then morphine is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine p. 306, transdermal fentanyl p. 311, hydromorphone hydrochloride p. 314, methadone hydrochloride p. 333, or oxycodone hydrochloride p. 317, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases In addition to the above approach, radiotherapy and bisphosphonates may be useful for pain due to bone metastases.

Neuropathic pain Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant, most commonly amitriptyline hydrochloride p. 267, for several weeks. An antiepileptic such as carbamazepine p. 218, may be added or substituted if pain persists. Ketamine p. 931 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 504, which reduces oedema around the tumour, thus reducing compression. Nerve blocks can be considered when pain is localised to a specific area. Transcutaneous electrical nerve stimulation (TENS) may also help.

Pain management with opioids

Oral route Treatment with morphine p. 315 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment or frailty. The dose is given either as an immediate-release preparation 4-hourly (for starting doses, see Morphine), or as a 12-hourly modified-release preparation, in addition to rescue doses. If replacing a weaker opioid analgesic (such as codeine phosphate p. 308), starting doses are usually higher.

If pain occurs between regular doses of morphine ('breakthrough pain'), an additional dose ('rescue dose') of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each child should be assessed on an individual basis.

Formulations of fentanyl p. 311 that are administered nasally, buccally or sublingually are not licensed for use in children; their usefulness in children is also limited by dose availability.

Children often require a higher dose of morphine in proportion to their body-weight compared to adults. Children are more susceptible to certain adverse effects of opioids such as urinary retention (which can be eased by bethanechol chloride), and opioid-induced pruritus.

When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

Once their pain is controlled, children started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine p. 315. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 317 can be used in children who require an opioid but cannot tolerate morphine. If the child is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic. Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.

Equivalent doses of opioid analgesics.

This table is only an **approximate** guide (doses may not correspond with those given in clinical practice); children should be carefully monitored after any change in medication and dose titration may be required.

Analgesic/Route	Dose
Codeine: PO	100 mg
Diamorphine: IM, IV, SC	3 mg
Dihydrocodeine: PO	100 mg
Hydromorphone: PO	2 mg
Morphine: PO	10 mg
Morphine: IM, IV, SC	5 mg
Oxycodone: PO	6.6 mg
Tramadol: PO	100 mg

PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

Parenteral route Diamorphine hydrochloride p. 309 is preferred for injection because, being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose is approximately a third of the oral dose of morphine p. 315. Subcutaneous infusion of diamorphine hydrochloride via a continuous infusion device can be useful (for details, see Continuous subcutaneous infusions).

If the child can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of diamorphine hydrochloride. See the table *Approximate equivalent doses of morphine and diamorphine*.

Rectal route Morphine p. 315 is also available for rectal administration as suppositories.

Transdermal route Transdermal preparations of fentanyl p. 311 and buprenorphine p. 306 [not licensed for use in children] are available; they are not suitable for acute pain or in those children whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations (see under fentanyl p. 311) because inappropriate use has caused fatalities.

The following 24-hour oral doses of morphine are considered to be *approximately* equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

Buprenorphine patches are *approximately* equivalent to the following 24-hour doses of oral morphine

morphine salt 12 mg daily	≡ buprenorphine '5' patch
morphine salt 24 mg daily	≡ buprenorphine '10' patch
morphine salt 36 mg daily	≡ buprenorphine '15' patch
morphine salt 48 mg daily	≡ buprenorphine '20' patch
morphine salt 84 mg daily	≡ buprenorphine '35' patch
morphine salt 126 mg daily	≡ buprenorphine '52.5' patch
morphine salt 168 mg daily	≡ buprenorphine '70' patch

Formulations of transdermal patches are available as 72-hourly, 96-hourly and 7-day patches, for further information see buprenorphine in BNF. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

72-hour Fentanyl patches are *approximately* equivalent to the following 24-hour doses of oral morphine

morphine salt 30 mg daily	≡ fentanyl '12' patch
morphine salt 60 mg daily	≡ fentanyl '25' patch
morphine salt 120 mg daily	≡ fentanyl '50' patch
morphine salt 180 mg daily	≡ fentanyl '75' patch
morphine salt 240 mg daily	≡ fentanyl '100' patch

Fentanyl equivalences in this table are for children on well-tolerated opioid therapy for long periods; fentanyl patches should not be used in opioid naive children. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

Symptom control

Unlicensed indications or routes Several recommendations in this section involve unlicensed indications or routes.

Anorexia Anorexia may be helped by prednisolone p. 508 or dexamethasone p. 504.

Anxiety Anxiety can be treated with a long-acting benzodiazepine such as diazepam p. 249, or by continuous infusion of the short-acting benzodiazepine midazolam p. 251. Interventions for more acute episodes of anxiety (such as panic attacks) include short-acting benzodiazepines such as lorazepam p. 250 given sublingually or midazolam

given subcutaneously. Temazepam p. 932 provides useful night-time sedation in some children.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid p. 88 by mouth; treatment is usually continued for one week after the bleeding has stopped but it can be continued at a reduced dose if bleeding persists. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 88 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 149 can be applied to the affected area.

Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K should be considered.

Constipation Constipation is a common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives. Suitable laxatives include osmotic laxatives (such as lactulose p. 44 or macrogols), stimulant laxatives (such as co-danthramer p. 48 and senna p. 49) or the combination of lactulose and a senna preparation. Naloxone hydrochloride p. 954 given by mouth may help relieve opioid-induced constipation; it is poorly absorbed but opioid withdrawal reactions have been reported.

Convulsions Intractable seizures are relatively common in children dying from non-malignant conditions. Phenobarbital p. 243 by mouth or as a continuous subcutaneous infusion may be beneficial; continuous infusion of midazolam p. 251 is an alternative. Both cause drowsiness, but this is rarely a concern in the context of intractable seizures. For breakthrough convulsions diazepam p. 249 given rectally (as a solution), buccal midazolam p. 251, or paraldehyde p. 248 as an enema may be appropriate.

See *Continuous subcutaneous infusions*, below, for the use of midazolam by subcutaneous infusion using a continuous infusion device.

Dry mouth Dry mouth may be caused by certain medications including opioid analgesics, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered. Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 804 or miconazole p. 803, alternatively, fluconazole p. 431 can be given by mouth.

Dysphagia A corticosteroid such as dexamethasone p. 504 may help, temporarily, if there is an obstruction due to tumour. See also *Dry mouth*, above.

Dyspnoea Breathlessness at rest may be relieved by regular oral morphine p. 315 in carefully titrated doses. Diazepam p. 249 may be helpful for dyspnoea associated with anxiety. Sublingual lorazepam p. 250 or subcutaneous or buccal midazolam p. 251 are alternatives. A nebulised short-acting beta$_2$ agonist or a corticosteroid, such as dexamethasone p. 504 or prednisolone p. 508, may also be helpful for bronchospasm or partial obstruction.

Excessive respiratory secretion Excessive respiratory secretion (death rattle) may be reduced by hyoscine hydrobromide patches p. 297 or by subcutaneous or intravenous injection of hyoscine hydrobromide p. 297, however, care must be taken to avoid the discomfort of dry mouth. Alternatively, glycopyrronium bromide p. 922 may be given.

Hyoscine hydrobromide p. 297 can be administered by subcutaneous or intravenous infusion using a continuous infusion device.

Fungating tumours Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 381 is often required to reduce malodour, but topical metronidazole p. 381 is also used.

Gastro-intestinal pain The pain of bowel colic may be reduced by loperamide hydrochloride p. 52. Hyoscine hydrobromide p. 297 may also be helpful in reducing the frequency of spasms; it is given sublingually as *Kwells*® tablets and also by subcutanous infusion.

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent and a prokinetic such as domperidone before meals.

Hiccup Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antiflatulent.

Insomnia Children with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 932, may be useful.

Intractable cough Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 315 every 4 hours. Methadone hydrochloride linctus p. 333 should be avoided because it has a long duration of action and tends to accumulate.

Mucosal bleeding Mucosal bleeding from the mouth and nose occurs commonly in the terminal phase, particularly in a child suffering from haemopoeitic malignancy. Bleeding from the nose caused by a single bleeding point can be arrested by cauterisation or by dressing it. Tranexamic acid p. 88 may be effective applied topically or given systemically.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 249 or baclofen p. 741.

Nausea and vomiting Nausea and vomiting are common in children with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started.

Nausea and vomiting with opioid therapy are less common in children than in adults but may occur particularly in the initial stages and can be prevented by giving an antiemetic. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide hydrochloride p. 292 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not therefore be used concurrently.

Haloperidol p. 274 is used by mouth or by continuous intravenous or subcutaneous infusion for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure).

Cyclizine p. 290 is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Ondansetron p. 295 is most effective when the vomiting is due to damaged or irritated gut mucosa (e.g. after chemotherapy or radiotherapy).

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

Levomepromazine p. 299 can be used if first-line antiemetics are inadequate. Dexamethasone p. 504 by mouth can be used as an adjunct.

See *Continuous subcutaneous infusions*, below, for the administration of antiemetics by subcutaneous infusion using a continuous infusion device.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. Ondansetron p. 295 may be effective in some children. Where opioid analgesics cause pruritus it may be appropriate to review the dose or to switch to an alternative opioid analgesic. In the case of obstructive jaundice, further measures include administration of colestyramine p. 142.

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 504, for 4 to 5 days, subsequently reduced if possible; dexamethasone p. 504 should be given before 6 p.m. to reduce the risk of insomnia. Treatment of headache and of associated nausea and vomiting should also be considered.

Restlessness and confusion Restlessness and confusion may require treatment with haloperidol p. 274. Levomepromazine p. 299 is also used occasionally for restlessness.

Continuous subcutaneous infusions

Although drugs can usually be administered *by mouth* to control symptoms in palliative care, the parenteral route may sometimes be necessary. Repeated administration of *intramuscular injections* should be avoided in children, particularly if cachectic. This has led to the use of portable continuous infusion devices such as syringe drivers to give a *continuous subcutaneous infusion*, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the **parenteral route** are:

- inability to take medicines by mouth owing to *nausea and vomiting*, *dysphagia*, *severe weakness*, or *coma*;
- *malignant bowel obstruction* for which surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube);
- refusal by the child to take regular medication by mouth.

Syringe driver rate settings Staff using syringe drivers should be **adequately trained** and different rate settings should be **clearly identified** and **differentiated**; incorrect use of syringe drivers is a common cause of medication errors.

Bowel colic and excessive respiratory secretions Hyoscine hydrobromide p. 297 effectively reduces respiratory secretions and is sedative (but occasionally causes paradoxical agitation); it is given in a *subcutaneous* or *intravenous infusion*. Glycopyrronium bromide p. 922 may also be used.

Hyoscine butylbromide p. 67 is effective in bowel colic, is less sedative than hyoscine hydrobromide p. 297, but is not always adequate for the control of respiratory secretions; it is given by *subcutaneous infusion* (**important**: *hyoscine butylbromide* must not be confused with *hyoscine hydrobromide*, above).

Confusion and restlessness Haloperidol p. 274 has little sedative effect. Levomepromazine p. 299 has a sedative effect. Midazolam p. 251 is a sedative and an antiepileptic that may be suitable for a very restless patient.

Convulsions If a child has previously been receiving an antiepileptic drug *or* has a primary or secondary cerebral tumour *or* is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 251 is the benzodiazepine antiepileptic of choice for *continuous subcutaneous infusion*.

Nausea and vomiting Levomepromazine p. 299 causes sedation in about 50% of patients. Haloperidol p. 274 has little sedative effect.

Cyclizine p. 290 is particularly likely to precipitate if mixed with diamorphine hydrochloride p. 309 or other drugs (see under *Mixing and compatibility*); it is given by *subcutaneous infusion*.

Pain control Diamorphine hydrochloride p. 309 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under *Mixing and compatibility*). The table shows approximate equivalent doses of morphine and diamorphine hydrochloride.

Mixing and compatibility The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 273, prochlorperazine p. 299, and diazepam p. 249 are **contra-indicated** as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 290 and levomepromazine p. 299 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 672) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1– 0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Compatibility with diamorphine Diamorphine can be given by *subcutaneous infusion* in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either *water for injections* or *physiological saline* (sodium chloride 0.9%) is a suitable diluent—above that strength only *water for injections* is used (to avoid precipitation).

The following can be mixed with *diamorphine*:

- **Cyclizine**, may precipitate at concentrations above 10 mg/mL *or* in the presence of sodium chloride 0.9% *or* as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- **Dexamethasone**, special care is needed to avoid precipitation of dexamethasone when preparing it.
- **Haloperidol**, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- **Hyoscine butylbromide**
- **Hyoscine hydrobromide**
- **Levomepromazine**
- **Metoclopramide**, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- **Midazolam**

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs *too quickly* check the rate setting and the calculation;
- if the subcutaneous infusion runs *too slowly* check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an *injection site reaction* make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours

These equivalences are *approximate only* and should be adjusted according to response

ORAL MORPHINE	PARENTERAL MORPHINE	PARENTERAL DIAMORPHINE
Oral morphine sulfate **over 24 hours**	Subcutaneous infusion of morphine sulfate **over 24 hours**	Subcutaneous infusion of diamorphine hydrochloride **over 24 hours**
30 mg	15 mg	10 mg
60 mg	30 mg	20 mg
90 mg	45 mg	30 mg
120 mg	60 mg	40 mg
180 mg	90 mg	60 mg
240 mg	120 mg	80 mg
360 mg	180 mg	120 mg
480 mg	240 mg	160 mg
600 mg	300 mg	200 mg
780 mg	390 mg	260 mg
960 mg	480 mg	320 mg
1200 mg	600 mg	400 mg

If breakthrough pain occurs give a subcutaneous injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. With an intermittent subcutaneous injection absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.

Drugs and sport

Anti-doping

UK Anti-Doping, the national body responsible for the UK's anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. Information regarding the use of medicines in sport is available from:

UK Anti-doping
Fleetbank House
2-6 Salisbury Square
London
EC4Y 8AE
(020) 7842 3450
ukad@ukad.org.uk
www.ukad.org.uk

Information about the prohibited status of specific medications based on the current World Anti-Doping Agency Prohibited List is available from Global Drug Reference Online: www.globaldro.com/UK/search

General Medical Council's advice

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual's performance in sport contravene the GMC's guidance, and such actions would usually raise a question of a doctor's continued registration. This does not preclude the provision of any care or treatment where the doctor's intention is to protect or improve the patient's health.

Medicines optimisation

Overview

Medicines are the most common intervention in healthcare for the prevention, treatment and/or management of many illnesses. As life expectancy increases and as the population ages, more people are living with several long-term conditions that are being managed with an increasing number of medicines. Medicines use can be complex and how patients can take their medicines safely and effectively is a challenge for the health service.

Multimorbidity (the presence of 2 or more long-term conditions) is associated with a greater use of health services, higher mortality, higher treatment burden (due to polypharmacy or multiple appointments), and reduced quality of life. The risk of patients suffering harm from their medicines increases with polypharmacy, and treatment

regimens (including non-pharmacological treatments) can very easily become burdensome for patients with multimorbidity and can lead to care becoming fragmented and uncoordinated. Prescribers should consider the risks and benefits of treatments recommended from guidance for single health conditions, as the evidence for these recommendations is regularly drawn from patients without multimorbidity and who are taking fewer prescribed regular medicines. The management of risk factors for future disease can also be a major treatment burden for patients with multimorbidity and should be taken into consideration.

Medicines optimisation encompasses many aspects of medicines use and helps to ensure that they are taken as intended, thus supporting the management of long-term conditions, multimorbidities, and appropriate polypharmacy. Through the adoption of a patient-focused approach to safe and effective medicines use, medicines optimisation changes the way patients are supported to get the best possible outcomes from their medicines. The use of shared decision-making informed by the best available evidence to guide decisions, ensures all patients have the opportunity to be involved in decisions about their medicines, taking into account their needs, preferences and values.

Overprescribing in the NHS has been reviewed by the Department of Health and Social Care in order to reduce the risk of harm, manage the spend on medicines, and ensure patients taking multiple medicines are receiving the most appropriate treatments for their needs. The national overprescribing review report is available at: www.gov.uk/government/publications/national-overprescribing-review-report.

Optimisation tools

Medicines optimisation includes aspects of care such as clinical assessment, clinical audits, disease prevention, health education, individual reviews and monitoring, and risk management. Having effective processes and systems in place can minimise the risk of preventable medicines-related problems (such as interactions with other medicines or comorbidities, and side-effects). Health and social care organisations should consider the use of multiple methods for identifying medicines-related patient safety incidents; learning from these incidents is important for guiding practice and minimising patient harm.

When optimising patient care, areas of intervention to consider include: deprescribing; medicines reconciliation, reviews and repeat prescribing; problematic polypharmacy; reducing medication waste and errors; and self-management plans. Self-management plans can be led by the child and their parents/carers or health professional, and vary in their content depending on the individual needs of the child, with the aim of supporting both them and their parents/carers involvement and empowerment in managing their condition.

Medication reviews involve a structured critical examination of a child's medicines to optimise treatment, minimise the number of medication-related problems, and reduce waste. These should be led by an appropriate health professional with effective communication skills, technical knowledge in the processes for managing medicines, and therapeutic knowledge on medicines use. Reviews can be carried out in different care settings, such as Primary Care Networks utilising pharmacists within the GP practice. For further information on review services available from community pharmacists, such as the 'New Medicines Service' and 'Medicines Use Review', see *Advanced pharmacy services*.

To support the medicines optimisation agenda, The Royal Pharmaceutical Society have produced good practice guidance for health professionals, which details four guiding principles for medicines optimisation. These are:

- Aim to understand the patient's experience;
- Evidence-based choice of medicines;
- Ensure medicines use is as safe as possible;
- Make medicines optimisation part of routine practice.

For further guidance around medicines optimisation and tools to use, NHS England have compiled useful links as part of **RightCare**; NICE have produced guidelines on **Medicines optimisation** and **Multimorbidity**; and the Scottish Government have produced a guideline on **Polypharmacy**, see *Useful resources*.

Advanced Pharmacy Services Advanced Services are provided as part of the NHS Community Pharmacy Contractual Framework, and include services such as the New Medicines Service and Medicines Use Review service. These services are provided by accredited community pharmacists, with the aim of targeting specific children to help manage their medicines more effectively, improve adherence, and reduce medicines wastage.

New Medicines Service The New Medicines Service (NMS) provides education and support to children who are newly prescribed a medicine to manage a long-term condition. The service is split into three stages; patient engagement, intervention and follow-up. As of 2018, this service is available for children living in England who have either been prescribed a new medicine for one of the following conditions – asthma, type 2 diabetes or hypertension, or have been prescribed a new antiplatelet or anticoagulant. Children can be offered the service by prescriber referral, or opportunistically by the community pharmacy. For further information, see: psnc.org.uk/services-commissioning/advanced-services/nms/.

Medicines Use Review The Medicines Use Review (MUR) service consists of structured adherence-centred reviews with children on multiple medicines, particularly those receiving medicines for long-term conditions. The service is undertaken periodically, not usually more than once a year, and can also be prompted when an adherence issue is identified during the dispensing service.

The pharmacist providing the MUR service must ensure that at least 70% of all MURs undertaken in a year are for children who fall within the two national target groups. The national target groups for MURs in England are:

- children taking high-risk medicines (NSAIDs, anticoagulants (including low molecular weight heparin), antiplatelets, or diuretics);
- children recently discharged from hospital who have had changes made to their medicines while they were in hospital.

For further information, see: psnc.org.uk/services-commissioning/advanced-services/murs/.

Wales, Northern Ireland, and Scotland have variations on this service, including different national target groups.

In Wales, see: www.cpwales.org.uk/Contract-support-and-IT/Advanced-Services.aspx.

In Northern Ireland, see: www.hscbusiness.hscni.net/services/2427.htm.

In Scotland, see: www.cps.scot/core-2/medicines-care-and-review.

Communication

As health professionals from various disciplines and specialties may be caring for the same child at the same time, good communication is required between health professionals in order to avoid fragmentation of care. Medication reviews may be carried out by health professionals other than the prescriber; therefore the prescriber should be informed of the review and its outcome—particularly if difficulties with adherence were discussed and further review is required.

There is a greater risk of poor communication and unintended medication changes when children transfer between different care providers (such as when a child is

admitted to or discharged from hospital). To support high-quality care when moving from one care setting to another, relevant information about medicines should be shared with children, their parents/carers, and between health and social care practitioners using robust and transparent processes. Information should be securely shared between health and social care practitioners ideally within 24 hours of patient transfer.

Good communication between health professionals, children and their parents/carers is needed for shared decision-making and supporting adherence. Information about their condition and possible treatments should be provided in a format that meets the child's and their parent's/carer's individual needs and preferences. The use of patient decision aids during consultations can help support a shared decision-making approach, and ensure children and their parents/carers are able to make well-informed choices that are consistent with their values and preferences.

For further guidance around communication between health professionals, children and their parents/carers, NICE have produced guidelines on **Medicines optimisation** and **Babies, children and young people's experience of healthcare** (see *Useful resources*). For guidance on the transition from paediatric to adult services, see *Transitional services for chronic conditions* in Guidance on prescribing p. 1.

Organisations such as the 'NHS Specialist Pharmacy Service' help support medicines optimisation across the NHS by joining health professionals together through online networks (e.g. Regional Medicines Optimisation Committees and the English Deprescribing Network). This is available at: www.sps.nhs.uk/.

Antimicrobial stewardship

Overview

Effective antimicrobials are required for preventive and curative measures, protecting patients from potentially fatal diseases, and ensuring that complex procedures can be provided at low risk of infection. Antimicrobial resistance (AMR) is the loss of antimicrobial effectiveness, and although it evolves naturally, this process is accelerated by the inappropriate or incorrect use of antimicrobials. Direct consequences of infection with resistant microorganisms can be severe and affect all areas of health, such as prolonged illnesses and hospital stays, increased costs and mortality, and reduced protection for patients undergoing operations or procedures. AMR is an international problem with an increasing prevalence that has consequences for the whole of society. The UK Government has recognised AMR as a significant area of concern and have committed global action to address this as a priority. For information and resources on the UK's plans for AMR, see the Public Health England (PHE) collection: **Antimicrobial resistance** (www.gov.uk/government/collections/antimicrobial-resistance-amr-information-and-resources).

Antimicrobial stewardship (AMS) refers to an organisational or healthcare system-wide approach to promoting and monitoring judicious use of antimicrobials to preserve their future effectiveness. Addressing AMR through improving stewardship is a national medicines optimisation priority, led by NHS England and supported by PHE.

AMR can be managed by a combination of interventions that address:

- A political commitment to prioritise AMR;
- Monitoring antimicrobial use and resistance in microbes;
- Development of new drugs, treatments, and diagnostics;
- Individuals' behaviour relating to infection prevention and control, antimicrobial use, and AMR;
- Healthcare professionals' prescribing decisions.

Guidance for organisations (commissioners and providers)

Commissioners (clinical commissioning groups and local authorities) and providers (e.g. hospitals, GPs, out-of-hours services, dentists, and social enterprises) of health or social care services should establish an AMS programme, taking into account the resources needed to support AMS across all care settings. An AMS programme should take into consideration monitoring and evaluating antimicrobial prescribing, regular feedback to individual prescribers, education and training for health and social care staff, and integrating audits into existing quality improvement programmes.

Commissioners should work collaboratively to provide consistent information and advice to the public and health professionals that reduces inappropriate antimicrobial demand and use, and limits the spread of infection. Local authority public health teams should ensure that information and resources (such as posters, leaflets and digital resources) are made available through multiple routes to provide a coordinated system of information. Information should include simple and practical steps such as scrupulous personal and safe food hygiene practices.

Organisations should involve lead health and social care staff in establishing processes for developing, reviewing, updating, and implementing local antimicrobial guidelines in line with national guidance and informed by local prescribing data and resistance patterns.

Organisations should also consider establishing processes for reviewing national horizon scanning to plan for the availability of new antimicrobials and to use an existing local decision-making group to consider the introduction of new antimicrobials locally.

Guidance for health and social care staff

Health and social care staff should assist with the implementation of local or national guidelines and recognise the significance of them for AMS.

Health professionals should be familiar with current AMS campaigns and programmes. For further information, see PHE and Health Education England's e-learning session **All Our Health: Antimicrobial Resistance** (portal.e-lfh.org.uk/Component/Details/571263), PHE guidance **Health matters: antimicrobial resistance** (www.gov.uk/government/publications/health-matters-antimicrobial-resistance), and the PHE campaigns **Antibiotic Guardian** (antibioticguardian.com/) and **Keep Antibiotics Working** (campaignresources.phe.gov.uk/resources/campaigns/58-keep-antibiotics-working).

Health professionals should be aware of resources and services that can help individuals minimise infections such as travel vaccination clinics, screening programmes, sexual health services, immunisation programmes, and other local referral pathways or schemes. The benefits of good hygiene, vaccination, and other preventative measures to reduce the risk of acquiring infections should be discussed with individuals, and individuals referred to further information or services if necessary.

Those involved in providing care should be educated about the standard principles of infection prevention and control. They should be trained in hand decontamination, the use of personal protective equipment, and the safe use and disposal of sharps. For further information, see NICE guideline: **Healthcare-associated infections** (see *Useful resources*).

Guidance on antimicrobial prescribing

National antimicrobial prescribing and stewardship competencies have been developed to improve the quality of antimicrobial treatment and stewardship. For further information, see Antimicrobial Resistance and Healthcare Associated Infections and PHE guidance: **Antimicrobial prescribing and stewardship competencies** (see *Useful resources*).

National toolkits to support the implementation of AMS best practice include the Royal College of General Practitioners' **TARGET antibiotics toolkit** (www.rcgp.org.uk/TARGETantibiotics) for primary care, and PHE's **Start smart – then focus** (www.gov.uk/government/publications/antimicrobial-stewardship-start-smart-then-focus) for secondary care, and **Dental antimicrobial stewardship: toolkit** (www.gov.uk/guidance/dental-antimicrobial-stewardship-toolkit) for dentists.

Clinical syndrome-specific guidance and advice to help slow the development of AMR have been developed by NICE, in collaboration with PHE, and are available at www.nice.org.uk/.

Considerations for antimicrobial prescribing

When deciding whether or not to prescribe an antimicrobial, undertake a clinical assessment and consider the risk of AMR for individual patients and the population as a whole. An immediate antimicrobial prescription for a patient who is likely to have a self-limiting condition is not recommended.

Document in the patient's records (electronically wherever possible) the decisions related to antimicrobial use, including the plan as discussed with the patient, and their family and/or carers (if appropriate), and reason for prescribing/not prescribing an antimicrobial.

In hospital, microbiological samples should be taken before initiating an antimicrobial for patients with suspected infection. In primary care, consider taking microbiological samples when prescribing an antimicrobial for patients with recurrent or persistent infections. The choice of antimicrobial should be reviewed when microbiological results are available. For non-severe infections, consider taking microbiological samples before making a decision about prescribing an antimicrobial, providing it is safe to withhold treatment until the results are available.

Follow local or national guidelines on prescribing the shortest effective course and most appropriate dose and route of administration. Review intravenous antimicrobials within 48 hours (taking into account response to treatment and microbiological results) and consider stepping down to oral antimicrobials where possible. If prescribing outside of local or national guidelines, document in the patient's records the reasons for the decision.

Patients on antimicrobial treatment should be appropriately monitored to reduce side-effects and be assessed on the continued need for treatment. Repeat antimicrobial prescriptions are not recommended, unless needed for a particular clinical condition or indication. Avoid issuing a repeat prescription for longer than 6 months without review.

Advice for patients and their family and/or carers

Prescribers, primary care and community pharmacy teams should provide patients with resources educating them about not asking for antimicrobials as a preventive measure against becoming ill or as a stand-by measure, unless the patient has a specific condition or a specific risk that requires antimicrobial prophylaxis.

Prescribers should discuss with patients, and their family and/or carers (if appropriate) the likely nature of the condition, their views on antimicrobials, benefits and harms of antimicrobial prescribing, and why prescribing an antimicrobial may not always be the best option. Information should be provided about what to do if their symptoms worsen or if problems arise as a result of treatment. Written information should be provided if needed.

If antimicrobial treatment is not the most appropriate option, prescribers should advise patients, and their family and/or carers (if appropriate) about other options (as appropriate), such as self-care with over-the-counter preparations, back-up (delayed) prescribing, or other non-pharmacological interventions. Prescribers, primary care and community pharmacy teams should verbally emphasise and provide written advice about managing self-limiting infections.

If antimicrobials are prescribed or supplied, prescribers, primary care and community pharmacy teams should provide patients with verbal and written information on the correct use of antimicrobials. Advice should encourage people to:

- Take, or use antimicrobials only when recommended by a suitably qualified health professional;
- Obtain antimicrobials only from a health professional;
- Take, or use antimicrobials as instructed (right dose for the duration specified and via the right route);
- Return any unused antimicrobials to a pharmacy for safe disposal.

Prescribing in dental practice

General guidance

Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections.

The following is a list of topics of particular relevance to dentists.

- Prescribing by dentists, see Prescription writing p. 4
- Oral side-effects of drugs, see Adverse reactions to drugs p. 11
- Medical emergencies in dental practice, see BNF
- Medical problems in dental practice, see BNF

Drug management of dental and oral conditions

Dental and orofacial pain, see Analgesics p. 301

- Neuropathic pain p. 325
- Non-opioid analgesics and compound analgesic preparations, see Analgesics p. 301
- Opioid analgesics, see Analgesics p. 301
- Non-steroidal anti-inflammatory drugs p. 742

Oral infections

Bacterial infections, see Antibacterials, principles of therapy p. 335

- Phenoxymethylpenicillin p. 387
- Broad-spectrum penicillins (amoxicillin p. 388 and ampicillin p. 390)
- Cephalosporins (cefalexin p. 359 and cefradine p. 361)
- Tetracyclines p. 403
- Macrolides (clarithromycin p. 375, erythromycin p. 378 and azithromycin p. 374)
- Clindamycin p. 373
- Metronidazole p. 381
- Fusidic acid p. 411

Fungal infections

Chapter 1
Gastro-intestinal system

CONTENTS

1 Chronic bowel disorders

1.1 Coeliac disease

Coeliac disease

25-Jul-2016

Description of condition

Coeliac disease is an autoimmune condition which is associated with chronic inflammation of the small intestine. Dietary proteins known as gluten, which are present in wheat, barley and rye, activate an abnormal immune response in the intestinal mucosa, which can lead to malabsorption of nutrients.

Aims of treatment

The management of coeliac disease is aimed at eliminating symptoms (such as diarrhoea, bloating and abdominal pain) and reducing the risk of complications, including those resulting from malabsorption.

Non-drug treatment

EvGr The only effective treatment for coeliac disease is a strict, life-long, gluten-free diet. A range of gluten-free products is available for prescription (see *Borderline substances*). A

Drug treatment

EvGr Children who have coeliac disease are at an increased risk of malabsorption of key nutrients (such as calcium and vitamin D). Supplementation of key nutrients may be required if dietary intake is insufficient.

Carers of children who have coeliac disease should be advised **not** to medicate with over-the-counter vitamin or mineral supplements. Initiation of supplementation should involve a discussion with a member of the child's healthcare team in order to identify the individual needs of the patient and to allow for appropriate ongoing monitoring. A

Useful Resources

Coeliac disease: recognition, assessment and management. National Institute for Health and Care Excellence. Clinical guideline 20. September 2015.
www.nice.org.uk/guidance/ng20

1.2 Inflammatory bowel disease

Crohn's disease

20-Dec-2016

Description of condition

Crohn's disease is a chronic, inflammatory bowel disease that mainly affects the gastro-intestinal tract. It is characterised by thickened areas of the gastro-intestinal wall with inflammation extending through all layers, deep ulceration and fissuring of the mucosa, and the presence of granulomas; affected areas may occur in any part of the gastro-intestinal tract, interspersed with areas of relatively normal tissue. Crohn's disease may present as recurrent attacks, with acute exacerbations combined with periods of remission or less active disease. Symptoms depend on the site of disease but may include abdominal pain, diarrhoea, fever, weight loss, and rectal bleeding.

Complications of Crohn's disease include intestinal strictures, abscesses in the wall of the intestine or adjacent structures, fistulae, anaemia, malnutrition, colorectal and small bowel cancers, and growth failure and delayed puberty in children. Crohn's disease may also be associated with extra-intestinal manifestation: the most common are arthritis and abnormalities of the joints, eyes, liver and skin. Crohn's disease is also a cause of secondary osteoporosis and those at greatest risk should be monitored for osteopenia and assessed for the risk of fractures.

Up to a third of patients with Crohn's disease are diagnosed before the age of 21 years but there is a lack of evidence regarding treatment for children. Paediatric practice is often based on extrapolation from adult studies.

Fistulating Crohn's disease

Fistulating Crohn's disease is a complication that involves the formation of a fistula between the intestine and adjacent structures, such as perianal skin, bladder, and vagina. It occurs in about one quarter of patients, mostly when the disease involves the ileocolonic area.

Aims of treatment

Treatment is largely directed at the induction and maintenance of remission and the relief of symptoms. Active

treatment of acute Crohn's disease should be distinguished from preventing relapse. The aims of drug treatment are to reduce symptoms and maintain or improve quality of life, while minimising toxicity related to drugs over both the short and long term. Drug treatment should always be initiated by a paediatric gastroenterologist.

In fistulating Crohn's disease, surgery and medical treatment aim to close and maintain closure of the fistula.

Non-drug treatment

EvGr In addition to drug treatment, management options for Crohn's disease include Smoking cessation p. 330 and attention to nutrition, which plays an important role in supportive care. Surgery may be considered in certain children with early disease limited to the distal ileum and in severe or chronic active disease. A

Drug treatment

Treatment of acute disease

Monotherapy

EvGr A corticosteroid (either prednisolone p. 508 or methylprednisolone p. 507 or intravenous hydrocortisone p. 506), is used to induce remission in children with a first presentation or a single inflammatory exacerbation of Crohn's disease in a 12-month period.

Enteral nutrition is an alternative to a corticosteroid when there is concern about growth or side effects.

In children with distal ileal, ileocaecal or right-sided colonic disease, in whom a conventional corticosteroid is unsuitable or contra-indicated, budesonide p. 35 [unlicensed] may be considered. Budesonide is less effective but may cause fewer side-effects than other corticosteroids, as systemic exposure is limited. Aminosalicylates (such as sulfasalazine p. 34 and mesalazine p. 32) are an alternative option in these children. They are less effective than a corticosteroid or budesonide [unlicensed], but may be preferred because they have fewer side-effects. Aminosalicylates and budesonide are not appropriate for severe presentations or exacerbations. A

Add-on treatment

EvGr Add on treatment is prescribed if there are two or more inflammatory exacerbations in a 12-month period, or the corticosteroid dose cannot be reduced.

Azathioprine p. 587 or mercaptopurine p. 617 [unlicensed indications] can be added to a corticosteroid or budesonide to induce remission. In children who cannot tolerate azathioprine or mercaptopurine or in whom thiopurine methyltransferase (TPMT) activity is deficient, methotrexate p. 618 can be added to a corticosteroid.

Under specialist supervision, the tumour necrosis factor-alpha inhibitors adalimumab p. 734 and infliximab p. 35 are options for the treatment of severe, active Crohn's disease, following inadequate response to conventional therapies or in those who are intolerant of or have contra-indications to conventional therapy. A See also *National funding/access decisions* for adalimumab and infliximab.

EvGr Adalimumab and infliximab can be used as monotherapy or combined with an immunosuppressant, although there is uncertainty about the comparative effectiveness. A There are concerns about the long-term safety of adalimumab and infliximab in children; malignancies, including hepatosplenic T- cell lymphoma, have been reported.

Maintenance of remission

EvGr Children, and their parents or carers, should be made aware of the risk of relapse with and without drug treatment, and symptoms that may suggest a relapse (most frequently unintended weight loss, abdominal pain, diarrhoea and general ill-health). For those who choose not to receive maintenance treatment during remission, a suitable follow up plan should be agreed upon and information provided on how to access healthcare if a relapse should occur.

Azathioprine or mercaptopurine [unlicensed indications] as monotherapy can be used to maintain remission when previously used with a corticosteroid to induce remission. They may also be used in children who have not previously received these drugs (particularly those with adverse prognostic factors such as early age of onset, perianal disease, corticosteroid use at presentation, and severe presentations). Methotrexate [unlicensed] can be used to maintain remission only in children who required methotrexate to induce remission, or who are intolerant of or are not suitable for azathioprine or mercaptopurine for maintenance. Corticosteroids or budesonide should not be used. A

Maintaining remission following surgery

EvGr Azathioprine in combination with up to 3 months' postoperative metronidazole p. 381 [unlicensed indication] should be considered to maintain remission in children with ileocolonic Crohn's disease who have had complete macroscopic resection within the previous 3 months. Azathioprine alone should be considered for patients who cannot tolerate metronidazole p. 381. A Aminosalicylates are no longer recommended due to the lack of clinical efficacy. NICE do not consider mercaptopurine to be a cost-effective treatment and do not recommend its use.

EvGr Biologic therapies should no longer be used to maintain remission after complete macroscopic resection of ileocolonic Crohn's disease because of limited evidence. Budesonide should also not be used in these patients. A

Other treatments

EvGr Loperamide hydrochloride p. 52 can be used to manage diarrhoea associated with Crohn's disease in children who do not have colitis. A Colestyramine p. 142 is licensed for the relief of diarrhoea associated with Crohn's disease. See also Diarrhoea (acute) p. 51.

Fistulating Crohn's disease

Perianal fistulae are the most common occurrence in children with fistulating Crohn's disease. EvGr Treatment may not be necessary for simple, asymptomatic perianal fistulae. When fistulae are symptomatic, local drainage and surgery may be required in conjunction with medical therapy.

Metronidazole p. 381 or ciprofloxacin p. 399 [unlicensed indications], alone or in combination, can improve symptoms of fistulating Crohn's disease but complete healing occurs rarely. Metronidazole should be given for at least 6 weeks but no longer than 3 months because of concerns about peripheral neuropathy. Other antibacterials should be given if specifically indicated (e.g. in sepsis associated with fistulae and perianal disease) and for managing bacterial overgrowth in the small bowel.

Either azathioprine p. 587 or mercaptopurine p. 617 [unlicensed indications] is used to control the inflammation in perianal and enterocutaneous fistulating Crohn's disease and they are continued for maintenance.

Infliximab p. 35 is recommended for children with perianal and enterocutaneous active fistulating Crohn's disease who have not responded to conventional therapy (including antibacterials, drainage and immunosuppressive treatments), or who are intolerant of or have contra-indications to conventional therapy. Infliximab should be used after ensuring that all sepsis is actively draining.

Abscess drainage, fistulotomy, and seton insertion may be appropriate, particularly before infliximab treatment.

Azathioprine, mercaptopurine or infliximab should be continued as maintenance treatment for at least one year.

For the management of non-perianal fistulating Crohn's disease (including entero-gynaecological and enterovesical fistulae) surgery is the only recommended approach. A

Ulcerative colitis

12-Nov-2021

Description of condition

Ulcerative colitis is a chronic inflammatory condition, characterised by diffuse mucosal inflammation—it has a relapsing-remitting pattern. It is a life-long disease that is associated with significant morbidity. Ulcerative colitis is more common in adults; however in children it predominately presents between the ages of 5 and 16 years.

The pattern of inflammation is continuous, extending from the rectum upwards to a varying degree. Inflammation of the rectum is referred to as **proctitis**, and inflammation of the rectum and sigmoid colon as **proctosigmoiditis**. **Left-sided colitis** refers to disease involving the colon distal to the splenic flexure. **Extensive colitis** affects the colon proximal to the splenic flexure, and includes pan-colitis, where the whole colon is involved. Child-onset ulcerative colitis is classified as extensive in 60–80% of all cases. Common symptoms of active disease or relapse include bloody diarrhoea, an urgent need to defaecate, and abdominal pain.

Complications associated with ulcerative colitis include an increased risk of colorectal cancer, secondary osteoporosis, venous thromboembolism, and toxic megacolon. Growth and pubertal development can be affected in children.

Aims of treatment

Treatment is focused on treating active disease to manage symptoms and to induce and maintain remission.

Drug treatment

Overview

Management of ulcerative colitis is dependent on factors such as clinical severity, extent of disease, and the child's preference. As limited distal disease is uncommon in children, paediatric treatment strategy depends mainly on disease severity rather than the extent of disease. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment. Severity is classified as mild, moderate or severe (or in remission) by using the Paediatric Ulcerative Colitis Activity Index to assess bowel movement, limitations on daily activity and the presence of abdominal pain or melaena—see the NICE guideline for Ulcerative Colitis for further information (see *Useful resources*).

EvGr The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or both are to be used. A

If the inflammation is distal, a rectal preparation is adequate, but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the child's preferences.

EvGr Rectal foam preparations and suppositories can be used when children have difficulty retaining liquid enemas.

Diarrhoea that is associated with active ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 52 [unlicensed under 4 years]) on the advice of a specialist; however their use is contra-indicated in acute ulcerative colitis as they can increase the risk of toxic megacolon.

A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 44) may be useful for proximal faecal loading in proctitis. E

Oral aminosalicylates for the treatment of ulcerative colitis are available in different preparations and release forms. EvGr The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the patient. When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

The duration of corticosteroid course (usually 4 to 8 weeks) depends on the corticosteroid chosen. A

Treatment of acute mild-to-moderate ulcerative colitis

Proctitis

EvGr A topical aminosalicylate is recommended as first-line treatment for children with a mild-to-moderate initial presentation or inflammatory exacerbation of proctitis. If remission is not achieved within 4 weeks, adding an oral aminosalicylate should be considered. If the response remains inadequate, consider adding a topical or an oral corticosteroid for 4 to 8 weeks.

Monotherapy with an oral aminosalicylate can be considered in children who prefer not to use enemas or suppositories, although this may not be as effective. If remission is not achieved within 4 weeks, adding a topical or an oral corticosteroid for 4 to 8 weeks should be considered.

A topical or an oral corticosteroid for 4 to 8 weeks should be considered for children in whom aminosalicylates are unsuitable. A

Proctosigmoiditis and left-sided ulcerative colitis

EvGr A topical aminosalicylate is recommended as first-line treatment for children with a mild-to-moderate initial presentation or inflammatory exacerbation of proctosigmoiditis or left-sided ulcerative colitis. If remission is not achieved within 4 weeks, consider adding a high-dose oral aminosalicylate, or switching to a high-dose oral aminosalicylate and 4 to 8 weeks of a topical corticosteroid. If response remains inadequate, stop topical treatment and offer an oral aminosalicylate and 4 to 8 weeks of an oral corticosteroid.

Monotherapy with a high-dose oral aminosalicylate can be considered for children who prefer not to use enemas or suppositories, although this may not be as effective. If remission is not achieved within 4 weeks, an oral corticosteroid for 4 to 8 weeks in addition to the high-dose aminosalicylate should be offered.

A topical or an oral corticosteroid for 4 to 8 weeks should be considered for children in whom aminosalicylates are unsuitable. A

Extensive ulcerative colitis

EvGr A topical aminosalicylate and a high-dose oral aminosalicylate is recommended as first-line treatment for children with a mild-to-moderate initial presentation or inflammatory exacerbation of extensive ulcerative colitis. If remission is not achieved within 4 weeks, stop topical aminosalicylate treatment and offer a high-dose oral aminosalicylate and 4 to 8 weeks of an oral corticosteroid. An oral corticosteroid for 4 to 8 weeks should be considered for children in whom aminosalicylates are unsuitable. A

Treatment of acute severe ulcerative colitis

Acute severe ulcerative colitis of any extent can be life-threatening and is regarded as a medical emergency. EvGr Immediate hospital admission is required for treatment.

Intravenous corticosteroids (such as hydrocortisone p. 506 or methylprednisolone p. 507) should be given to induce remission in children with acute severe ulcerative colitis (whether it is a first presentation or an inflammatory exacerbation) while assessing the need for surgery. If intravenous corticosteroids are contra-indicated, declined or cannot be tolerated, then intravenous ciclosporin p. 588 [unlicensed indication], or surgery should be considered. A combination of intravenous ciclosporin with intravenous corticosteroids, or surgery is second line therapy for children

who have little or no improvement within 72 hours of starting intravenous corticosteroids or in children whose symptoms worsen despite treatment with a corticosteroid. Ⓐ

EvGr Alternatively, infliximab p. 35 can be used on specialist advice in children over 6 years, if there is little or no improvement within 72 hours of starting intravenous corticosteroids or in children whose symptoms worsen despite treatment with a corticosteroid.

In patients who experience an initial response to steroids followed by deterioration, stool cultures should be taken to exclude pathogens; cytomegalovirus activation should be considered. Ⓔ

Infliximab for ulcerative colitis

EvGr Infliximab can be used to treat acute severe active ulcerative colitis in children over 6 years who have had an inadequate response to conventional treatment (including corticosteroids and azathioprine p. 587 or mercaptopurine p. 617) or if conventional treatment is not tolerated or contra-indicated. Treatment with these agents is continued into the maintenance phase if effective and tolerated.

Infliximab can also be used to treat acute exacerbations of severely active ulcerative colitis in children over 6 years, if ciclosporin p. 588 is contra-indicated or clinically inappropriate. Ⓐ

Maintaining remission in mild, moderate or severe ulcerative colitis

EvGr To reduce the chances of relapse occurring, maintenance therapy with an aminosalicylate is recommended in most children. Corticosteroids are **not** suitable for maintenance treatment because of their side-effects.

After a mild-to-moderate inflammatory exacerbation of *proctitis* or *proctosigmoiditis*, a rectal aminosalicylate can be started alone or in combination with an oral aminosalicylate, administered daily or as part of an intermittent regimen (such as twice to three times weekly or the first seven days of each month). An oral aminosalicylate can be used alone in children who prefer not to use enemas or suppositories, although this may not be as effective.

A low dose of oral aminosalicylate is given to maintain remission in children after a mild-to-moderate inflammatory exacerbation of *left-sided or extensive* ulcerative colitis.

When used to maintain remission, single daily dosing of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

Oral azathioprine or mercaptopurine [unlicensed indications] can be considered to maintain remission, if there has been two or more inflammatory exacerbations in a 12-month period that require treatment with systemic corticosteroids or if remission is not maintained by aminosalicylates, or following a single acute severe episode. Ⓐ EvGr Oral azathioprine or mercaptopurine is usually required in these cases as an aminosalicylate alone may be ineffective in more severe disease. Ⓔ

There is no evidence to support the use of methotrexate p. 618 to induce or maintain remission in ulcerative colitis though its use is common in clinical practice.

Non-drug treatment

EvGr Surgery may be necessary as emergency treatment for severe ulcerative colitis that does not respond to drug treatment. Patients can also choose to have elective surgery for unresponsive or frequently relapsing disease that is affecting their quality of life. Ⓐ

AMINOSALICYLATES

Aminosalicylates

- **SIDE-EFFECTS**
  - **Common or very common** Arthralgia · cough · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · leucopenia · nausea · skin reactions · vomiting
  - **Uncommon** Alopecia · depression · dyspnoea · myalgia · photosensitivity reaction · thrombocytopenia
  - **Rare or very rare** Agranulocytosis · bone marrow disorders · cardiac inflammation · hepatitis · neutropenia · pancreatitis · peripheral neuropathy · renal impairment · respiratory disorders
  - **Frequency not known** Angioedema · eosinophilia · haemolytic anaemia · nephritis tubulointerstitial · oligozoospermia (reversible) · ulcerative colitis aggravated

  SIDE-EFFECTS, FURTHER INFORMATION A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated in salicylate hypersensitivity Ⓜ.
- **MONITORING REQUIREMENTS** Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.
- **PATIENT AND CARER ADVICE**

  Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

F above

Balsalazide sodium

24-Jun-2021

- **INDICATIONS AND DOSE**

  Treatment of mild to moderate ulcerative colitis, acute attack
  - BY MOUTH
  - Child 12–17 years: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks

  Maintenance of remission of ulcerative colitis
  - BY MOUTH
  - Child 12–17 years: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day
- **UNLICENSED USE** Not licensed for use in children under 18 years.
- **CAUTIONS** History of asthma
- **INTERACTIONS** → Appendix 1: balsalazide
- **SIDE-EFFECTS** Blood disorder · cholelithiasis · lupus-like syndrome
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Diarrhoea may develop in the infant. **Monitoring** Monitor breast-fed infants for diarrhoea.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** EvGr Use with caution in mild impairment; avoid in moderate to severe impairment. Ⓜ
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

DOSE EQUIVALENCE AND CONVERSION

There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

ASACOL® MR 400MG TABLETS

Treatment of mild to moderate ulcerative colitis, acute attack

- BY MOUTH
- Child 12–17 years: 800 mg 3 times a day

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

- BY MOUTH
- Child 12–17 years: 400–800 mg 2–3 times a day

ASACOL® FOAM ENEMA

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- BY RECTUM
- Child 12–17 years: 1 g daily for 4–6 weeks, to be administered into the rectum

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon

- BY RECTUM
- Child 12–17 years: 2 g once daily for 4–6 weeks, to be administered into the rectum

ASACOL® SUPPOSITORIES

Treatment and maintenance of remission of ulcerative colitis affecting the rectosigmoid region

- BY RECTUM
- Child 12–17 years: 250–500 mg 3 times a day, last dose to be administered at bedtime

OCTASA®

Treatment of mild to moderate ulcerative colitis, acute attack

- BY MOUTH
- Child 6–17 years (body-weight 40 kg and above): 2.4–4 g daily in divided doses

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

- BY MOUTH
- Child 6–17 years (body-weight 40 kg and above): 1.2–2 g once daily, alternatively daily in divided doses

PENTASA® GRANULES

Treatment of mild to moderate ulcerative colitis, acute attack

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses

Maintenance of remission of ulcerative colitis

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 2 g once daily

PENTASA® RETENTION ENEMA

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- BY RECTUM
- Child 12–17 years: 1 g once daily, dose to be administered at bedtime

PENTASA® SUPPOSITORIES

Treatment of acute attack, ulcerative proctitis

- BY RECTUM
- Child 12–17 years: 1 g daily for 2–4 weeks

Maintenance, ulcerative proctitis

- BY RECTUM
- Child 12–17 years: 1 g daily

PENTASA® TABLETS

Treatment of mild to moderate ulcerative colitis, acute attack

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3 divided doses

Maintenance of remission of ulcerative colitis

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 2 g once daily

SALOFALK® ENEMA

Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

- BY RECTUM
- Child 12–17 years: 2 g once daily, dose to be administered at bedtime

SALOFALK® GRANULES

Treatment of mild to moderate ulcerative colitis, acute attack

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day

Maintenance of remission of ulcerative colitis

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 500 mg 3 times a day

SALOFALK® RECTAL FOAM

Treatment of mild ulcerative colitis affecting sigmoid colon and rectum

- BY RECTUM
- Child 12–17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

SALOFALK® SUPPOSITORIES

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon, and descending colon

- BY RECTUM
- Child 12–17 years: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

SALOFALK® TABLETS

Treatment of mild to moderate ulcerative colitis, acute attack

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day

Maintenance of remission of ulcerative colitis

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 500 mg 3 times a day

- **UNLICENSED USE**
- With oral use *Asacol*® (all preparations) not licensed for use in children under 18 years. *Pentasa*® tablets not licensed for use in children under 15 years. *Pentasa*® granules and *Salofalk*® tablets and granules not licensed for use in children under 6 years.
- With rectal use *Asacol*® (all preparations) and *Salofalk*® enema not licensed for use in children under 18 years. *Salofalk*® suppositories and *Pentasa*® suppositories not licensed for use in children. *Salofalk*® rectal foam no dose recommendations for children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS**
- With oral use Blood clotting abnormalities

- **CAUTIONS** Maintain adequate fluid intake · pulmonary disease

- **INTERACTIONS** → Appendix 1: mesalazine

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare or very rare** Cholestasis exacerbated · drug fever · flatulence · nephritis

SPECIFIC SIDE-EFFECTS

- **Rare or very rare**
- With rectal use Constipation

- **PREGNANCY** Negligible quantities cross placenta.

- **BREAST FEEDING** Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk.

Monitoring Monitor breast-fed infant for diarrhoea.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** EvGr Use with caution in mild to moderate impairment (risk of toxicity including crystalluria); avoid in severe impairment. M

- **DIRECTIONS FOR ADMINISTRATION**

PENTASA® TABLETS Manufacturer advises tablets may be halved, quartered, or dispersed in water, but should not be chewed.

PENTASA® GRANULES Manufacturer advises granules should be placed on tongue and washed down with water or orange juice without chewing.

Expert sources advise contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

SALOFALK® GRANULES Manufacturer advises granules should be placed on tongue and washed down with water without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION** There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

Flavours of granule formulations of *Salofalk*® may include vanilla.

- **PATIENT AND CARER ADVICE** If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms. Some products may require special administration advice; patients and carers should be informed.

  - **Mesalazine 1 gram** Pentasa 1g modified-release granules sachets sugar-free | 50 sachet PoM £30.74 DT = £30.74
  - **Mesalazine 2 gram** Pentasa 2g modified-release granules sachets sugar-free | 60 sachet PoM £73.78 DT = £73.78
- **Salofalk** (Dr. Falk Pharma UK Ltd)
  - **Mesalazine 1 gram** Salofalk 1g gastro-resistant modified-release granules sachets sugar-free | 50 sachet PoM £28.74 DT = £28.74

Mesalazine 1.5 gram Salofalk 1.5g gastro-resistant modified-release granules sachets sugar-free | 60 sachet PoM £48.85 DT = £48.85
Mesalazine 3 gram Salofalk 3g gastro-resistant modified-release granules sachets sugar-free | 60 sachet PoM £97.70 DT = £97.70

Enema

- Pentasa (Ferring Pharmaceuticals Ltd)
  Mesalazine 10 mg per 1 ml Pentasa Mesalazine 1g/100ml enema | 7 enema PoM £17.73 DT = £17.73
- Salofalk (Dr. Falk Pharma UK Ltd)
  Mesalazine 33.9 mg per 1 ml Salofalk 2g/59ml enema | 7 enema PoM £29.92 DT = £29.92

31

Olsalazine sodium

24-Jun-2021

● **INDICATIONS AND DOSE**

Treatment of acute attack of mild ulcerative colitis

- BY MOUTH
- Child 2–17 years: 500 mg twice daily, dose to be taken after food, then increased if necessary up to 1 g 3 times a day, dose to be increased over 1 week

Maintenance of remission of mild ulcerative colitis

- BY MOUTH
- Child 2–17 years: Maintenance 250–500 mg twice daily, dose to be taken after food

● **UNLICENSED USE** Not licensed for use in children under 12 years.

● **SIDE-EFFECTS**

- **Uncommon** Paraesthesia · tachycardia
- **Frequency not known** Palpitations · vision blurred

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING**
Monitoring Monitor breast-fed infants for diarrhoea.

● **RENAL IMPAIRMENT** EvGr Use with caution in mild to moderate impairment; avoid in significant impairment. Ⓜ

● **DIRECTIONS FOR ADMINISTRATION** Expert sources advise capsules can be opened and contents sprinkled on food.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- Olsalazine sodium (Non-proprietary)
  Olsalazine sodium 500 mg Olsalazine 500mg tablets | 60 tablet PoM £161.00 DT = £161.00

Capsule

CAUTIONARY AND ADVISORY LABELS 21

- Olsalazine sodium (Non-proprietary)
  Olsalazine sodium 250 mg Olsalazine 250mg capsules | 112 capsule PoM £144.00 DT = £144.00

31

Sulfasalazine

(Sulphasalazine)

24-Jun-2021

● **INDICATIONS AND DOSE**

Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn's disease

- BY MOUTH
- Child 2–11 years: 10–15 mg/kg 4–6 times a day (max. per dose 1 g) until remission occurs; increased if necessary up to 60 mg/kg daily in divided doses
- Child 12–17 years: 1–2 g 4 times a day until remission occurs
- BY RECTUM
- Child 5–7 years: 500 mg twice daily
- Child 8–11 years: 500 mg, dose to be administered in the morning and 1 g, dose to be administered at night
- Child 12–17 years: 0.5–1 g twice daily

Maintenance of remission of mild to moderate and severe ulcerative colitis

- BY MOUTH
- Child 2–11 years: 5–7.5 mg/kg 4 times a day (max. per dose 500 mg)
- Child 12–17 years: 500 mg 4 times a day
- BY RECTUM
- Child 5–7 years: 500 mg twice daily
- Child 8–11 years: 500 mg, dose to be administered in the morning and 1 g, dose to be administered at night
- Child 12–17 years: 0.5–1 g twice daily

Juvenile idiopathic arthritis

- BY MOUTH
- Child 2–11 years: Initially 5 mg/kg twice daily for 1 week, then 10 mg/kg twice daily for 1 week, then 20 mg/kg twice daily for 1 week; maintenance 20–25 mg/kg twice daily; maximum 2 g per day
- Child 12–17 years: Initially 5 mg/kg twice daily for 1 week, then 10 mg/kg twice daily for 1 week, then 20 mg/kg twice daily for 1 week; maintenance 20–25 mg/kg twice daily; maximum 3 g per day

● **UNLICENSED USE** Not licensed for use in children for juvenile idiopathic arthritis.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Sulfasalazine has been confused with sulfadiazine; care must be taken to ensure the correct drug is prescribed and dispensed.

● **CONTRA-INDICATIONS** Child under 2 years of age

● **CAUTIONS** Acute porphyrias p. 688 · G6PD deficiency · history of allergy · history of asthma · maintain adequate fluid intake · risk of haematological toxicity · risk of hepatic toxicity · slow acetylator status

● **INTERACTIONS** → Appendix 1: sulfasalazine

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Insomnia · stomatitis · taste altered · tinnitus · urine abnormalities
- **Uncommon** Face oedema · seizure · vasculitis · vertigo
- **Frequency not known** Anaemia · appetite decreased · ataxia · cyanosis · encephalopathy · haematuria · hallucination · hepatic failure · hypoprothrombinaemia · lymphadenopathy · macrocytosis · meningitis aseptic · methaemoglobinaemia · nephrotic syndrome · parotitis · periorbital oedema · pseudomembranous enterocolitis · serum sickness · severe cutaneous adverse reactions (SCARs) · smell disorders · systemic lupus erythematosus (SLE) · yellow discolouration of body fluids

SPECIFIC SIDE-EFFECTS

- With oral use Urine discolouration

SIDE-EFFECTS, FURTHER INFORMATION Incidence of side-effects increases with higher doses.

Blood disorders Haematological abnormalities occur usually in the first 3 to 6 months of treatment—discontinue if these occur.

● **PREGNANCY** Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.

● **BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** EvGr Use with caution in mild to moderate impairment (risk of toxicity including crystalluria); avoid in severe impairment. Ⓜ
- **MONITORING REQUIREMENTS**
  - Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
  - Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
  - Liver function Liver function tests should be performed at monthly intervals for first 3 months.
- **PATIENT AND CARER ADVICE**
  Contact lenses Some soft contact lenses may be stained.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

CAUTIONARY AND ADVISORY LABELS 14
EXCIPIENTS: May contain Alcohol

CORTICOSTEROIDS

502

Budesonide

08-Mar-2022

- **DRUG ACTION** Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

- **INDICATIONS AND DOSE**

BUDENOFALK® CAPSULES

Mild to moderate Crohn's disease affecting the ileum and/or ascending colon

- BY MOUTH
- Child 12–17 years: 3 mg 3 times a day for up to 8 weeks, reduce dose gradually over 2 weeks following treatment course before stopping

ENTOCORT® CAPSULES

Mild to moderate Crohn's disease affecting the ileum and/or ascending colon

- BY MOUTH
- Child 12–17 years: 9 mg once daily for up to 8 weeks, to be taken in the morning, when stopping treatment, reduce dose for the last 2–4 weeks of therapy

ENTOCORT® ENEMA

Ulcerative colitis involving rectal and recto-sigmoid disease

- BY RECTUM
- Child 12–17 years: 1 enema daily for 4 weeks, to be administered at bedtime

- **UNLICENSED USE** Not licensed for use in children for Crohn's disease or ulcerative colitis.
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS**
  - **Common or very common**
  - With oral use Muscle twitching · oedema · oral disorders
  - With rectal use Diarrhoea · gastrointestinal disorders
- **HEPATIC IMPAIRMENT** For *Budenofalk*® manufacturer advises avoid in cirrhosis (risk of increased exposure, limited information available).
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use Expert sources advise capsules can be opened and the contents mixed with apple or orange juice.
- **PRESCRIBING AND DISPENSING INFORMATION**
  ENTOCORT® CAPSULES Dispense modified-release capsules in original container (contains desiccant).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 5, 10, 22, 25

- **Budenofalk** (Dr. Falk Pharma UK Ltd)
  Budesonide 3 mg Budenofalk 3mg gastro-resistant capsules | 100 capsule PoM £75.05 DT = £75.05

  Budesonide 20 microgram per 1 ml Entocort 2mg/100ml enema | 7 enema PoM £33.66 DT = £33.66

IMMUNOSUPPRESSANTS › TUMOR NECROSIS FACTOR ALPHA (TNF-α) INHIBITORS

Infliximab

25-Feb-2022

- **INDICATIONS AND DOSE**

Active Crohn's disease (under expert supervision)

- BY INTRAVENOUS INFUSION
- Child 6–17 years: Initially 5 mg/kg, then 5 mg/kg, to be taken at week 2 and 6 after initial dose, then maintenance 5 mg/kg every 8 weeks, interval between maintenance doses adjusted according to response; discontinue if no response within 10 weeks of initial infusion (after 3 doses)

Fistulating Crohn's disease (under expert supervision)

- BY INTRAVENOUS INFUSION
- Child 6–17 years: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

Active ulcerative colitis (under expert supervision)

- BY INTRAVENOUS INFUSION
- Child 6–17 years: Initially 5 mg/kg, then 5 mg/kg, to be taken at week 2 and 6 after initial dose, then 5 mg/kg every 8 weeks, discontinue if no response within 8 weeks of initial infusion (after 3 doses)

- **UNLICENSED USE** Not licensed for fistulating Crohn's disease in children.

IMPORTANT SAFETY INFORMATION
Adequate resuscitation facilities must be available when infliximab is used.

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infections
- **CAUTIONS** Demyelinating disorders (risk of exacerbation) · dermatomyositis · development of malignancy · hepatitis B virus—monitor for active infection · history of malignancy · history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection (discontinue if new serious infection develops) · risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (re-administration after interval exceeding 16 weeks not recommended)

CAUTIONS, FURTHER INFORMATION

- Infection Manufacturer advises patients should be up-to-date with current immunisation schedule before initiating treatment.
- Tuberculosis Manufacturer advises to evaluate patients for active and latent tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).
- Hypersensitivity reactions Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- **Common or very common** Abscess · alopecia · anaemia · arrhythmias · arthralgia · chest pain · chills · constipation · decreased leucocytes · depression · diarrhoea · dizziness · dyspnoea · eye inflammation · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperhidrosis · hypertension · hypotension · increased risk of infection · infusion related reaction · insomnia · lymphadenopathy · myalgia · nausea · neutropenia · oedema · pain · palpitations · respiratory disorders · sensation abnormal · sepsis · skin reactions · vasodilation · vertigo
- **Uncommon** Anxiety · cheilitis · cholecystitis · confusion · drowsiness · healing impaired · heart failure · hypersensitivity · lupus erythematosus · lymphocytosis · memory loss · neoplasms · nerve disorders · pancreatitis · peripheral ischaemia · pulmonary oedema · seborrhoea · seizure · syncope · thrombocytopenia · thrombophlebitis
- **Rare or very rare** Agranulocytosis · circulatory collapse · cyanosis · demyelinating disorders · granuloma · haemolytic anaemia · hepatitis B reactivation · meningitis · pancytopenia · pericardial effusion · sarcoid-like reaction · severe cutaneous adverse reactions (SCARs) · transverse myelitis · vasculitis · vasospasm
- **Frequency not known** Bone fracture · dermatomyositis exacerbated · hepatosplenic T-cell lymphoma (increased risk in inflammatory bowel disease) · myocardial infarction · myocardial ischaemia · sarcoidosis · stroke · ulcerative colitis aggravated · vision loss

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after last dose.
- **PREGNANCY** Use only if essential.
- **BREAST FEEDING** Specialist sources indicate amount present in milk probably too small to be harmful.
- **PRE-TREATMENT SCREENING**
Tuberculosis Manufacturer advises patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
- Monitor for infection before, during, and for 6 months after treatment.
- All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).
- Monitor for symptoms of delayed hypersensitivity if re-administered after a prolonged period.
- Manufacturer advises periodic skin examination for non-melanoma skin cancer, particularly in patients with risk factors.

- **DIRECTIONS FOR ADMINISTRATION** EvGr For *intermittent intravenous infusion*, dilute reconstituted solution with Sodium Chloride 0.9%. Reconstitute each 100 mg vial with 10 mL Water for Injections using a 21-gauge or smaller needle and gently swirl vial without shaking to dissolve; allow to stand for 5 minutes. Dilute requisite dose with infusion fluid to a usual final volume of 250 mL (maximum concentration 4 mg/mL). Give over 2 hours through a low protein-binding filter (1.2 micron or less). Start infusion within 3 hours of reconstitution. M
- **PRESCRIBING AND DISPENSING INFORMATION** Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE**
Tuberculosis Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.
Blood disorders Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.
Hypersensitivity reactions Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.
Alert card An alert card should be provided.
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

1.3 Irritable bowel syndrome

Irritable bowel syndrome

02-May-2020

Description of condition

Irritable bowel syndrome (IBS) is a gastrointestinal disorder characterised by abdominal pain or discomfort that may be relieved by defaecation. It can also be associated with the passage of mucus, bloating, and disordered defaecation; either diarrhoea, constipation, or alternating diarrhoea and constipation. Constipation presents with straining, urgency, and a sensation of incomplete evacuation. Before a diagnosis of IBS is made, the symptoms should be present at least once per week for at least 2 months and other potential pathological causes of the symptoms should be excluded. IBS symptoms are often aggravated by psychological factors, such as anxieties, emotional stress, and fear.

Aims of treatment

Treatment of IBS is focused on symptom control in order to improve quality of life, including minimising abdominal pain and normalising the frequency and consistency of stools.

Non-drug treatment

EvGr There is no evidence of the effectiveness of any form of dietary advice or increased fibre intake in children and it is not known whether dietary advice recommended to adult patients is of benefit to children. A

EvGr Eating regularly, limiting fresh fruit intake, and, reducing intake of 'resistant starch' and insoluble fibre (e.g. bran) can be recommended. If an increase in dietary fibre is required, soluble fibre such as oats, ispaghula husk p. 43, or sterculia p. 43 can be recommended. Ensuring a sufficient intake of fluids can also be recommended. E

Drug treatment

EvGr Clinicians should only prescribe drugs for children with IBS in cases of severe symptoms that have not responded to non-drug approaches. Treatment options include laxatives, antimotility drugs or antispasmodic drugs. A

EvGr A laxative can be used to treat abdominal pain if the underlying cause is suspected to be constipation. An osmotic laxative, such as a macrogol or lactulose p. 44, is preferred; lactulose may cause flatulence during the first few days of treatment. Loperamide hydrochloride p. 52 may relieve diarrhoea and antispasmodic drugs may relieve pain. E

ANTISPASMODICS

Mebeverine with ispaghula husk

09-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, mebeverine hydrochloride p. 68, ispaghula husk p. 43.

- **INDICATIONS AND DOSE**

Irritable bowel syndrome

- BY MOUTH
- Child 12–17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises contents of one sachet should be stirred into a glass (approx. 150 mL) of cold water and drunk immediately.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ispaghula husk with mebeverine granules.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Effervescent granules

CAUTIONARY AND ADVISORY LABELS 13, 22

1.4 Short bowel syndrome

Short bowel syndrome

31-Aug-2016

Description of condition

Children with a shortened bowel due to large surgical resection (with or without stoma formation) may require medical management to ensure adequate absorption of nutrients and fluid. Absorption of oral medication is also often impaired.

Aims of treatment

The management of short bowel syndrome focuses on ensuring adequate nutrition and drug absorption, thereby reducing the risk of complications resulting from these effects.

Drug treatment

Nutritional deficiencies

EvGr Children with a short bowel may require replacement of vitamins and minerals depending on the extent and position of the bowel resection. Deficiencies in vitamins A, B_{12}, D, E, and K, essential fatty acids, zinc and selenium can occur.

Hypomagnesaemia is common and is treated with oral or intravenous magnesium supplementation (see Magnesium imbalance p. 680), though administration of oral magnesium may cause diarrhoea. Occasionally the use of oral alfacalcidol p. 718 and correction of sodium depletion may be useful. Nutritional support can range from oral supplements to parenteral nutrition, depending on the severity of intestinal failure. A

Diarrhoea and high output stomas

Diarrhoea is a common symptom of short bowel syndrome and can be due to multiple factors. EvGr The use of oral rehydration salts can be considered in order to promote adequate hydration. Oral intake influences the volume of stool passed, so reducing food intake will lessen diarrhoea, but will also exacerbate the problems of undernutrition. A child may require parenteral nutrition to allow them to eat less if the extent of diarrhoea is unacceptable.

Pharmacological treatment may be necessary, with the choice of drug depending on the potential for side-effects and the degree of resection. A

Antimotility drugs

EvGr Loperamide hydrochloride p. 52 reduces intestinal motility and thus exerts antidiarrhoeal actions. Loperamide hydrochloride is preferred over other antimotility drugs as it is not sedative and does not cause dependence or fat malabsorption. High doses of loperamide hydrochloride [unlicensed] may be required in children with a short bowel due to disrupted enterohepatic circulation and a rapid gastro-intestinal transit time.

Co-phenotrope p. 52 has traditionally been used alone or in combination with other medications to help decrease faecal output. Co-phenotrope crosses the blood–brain barrier and can produce central nervous system side-effects, which may limit its use; the potential for dependence and anticholinergic effects may also restrict its use. A

Colestyramine

EvGr In children with an intact colon and less than 100 cm of ileum resected, colestyramine p. 142 can be used to bind the unabsorbed bile salts, which reduces diarrhoea. When colestyramine is given to these children, it is important to monitor for evidence of fat malabsorption (steatorrhoea) or fat-soluble vitamin deficiencies. A

Antisecretory drugs

EvGr Drugs that reduce gastric acid secretion reduce jejunostomy output. Omeprazole p. 63 is readily absorbed in the duodenum and upper small bowel, but if less than 50 cm of jejunum remains, it may need to be given intravenously. Use of a proton pump inhibitor alone does not eliminate the need for further intervention for fluid control (such as antimotility agents, intravenous fluids, or oral rehydration salts). A

Growth factors

Growth factors can be used to facilitate intestinal adaptation after surgery in children with short bowel syndrome, thus enhancing fluid, electrolyte, and micronutrient absorption.

Teduglutide below is an analogue of endogenous human glucagon-like peptide 2 (GLP-2) which is licensed for use in the management of short bowel syndrome in children aged one year and over. It may be considered after a period of stabilisation following surgery, during which intravenous fluids and nutritional support should have been optimised.

Drug absorption

For *Prescribing in children with stoma* see Stoma care p. 78.

EvGr Many drugs are incompletely absorbed by children with a short bowel and may need to be prescribed in much higher doses than usual (such as levothyroxine, warfarin, oral contraceptives, and digoxin) or may need to be given intravenously. A

Several factors can alter the absorption of drugs taken by mouth in children with a compromised gastrointestinal system. The most important factors are the length of intestine available for drug absorption, and which section has been removed. The small intestine, with its large surface area and high blood flow, is the most important site of drug absorption. The larger the amount of the small intestine that has been removed, the higher the possibility that drug absorption will be affected. Other factors such as gastric emptying and gastric transit time also affect drug handling.

EvGr Enteric-coated and modified-release preparations are unsuitable for use in patients with short bowel syndrome, particularly in children with an ileostomy, as there may not be sufficient release of the active ingredient.

Dosage forms with quick dissolution (such as soluble tablets) should be used. Uncoated tablets and liquid formulations may also be suitable. A EvGr Before prescribing liquid formulations, prescribers should consider the osmolarity, excipient content, and volume required. Hyperosmolar liquids and some excipients (such as sorbitol) can result in fluid loss. The calorie density of oral supplements should also be considered, as it will influence the volume to be taken. E

AMINO ACIDS AND DERIVATIVES

Teduglutide

22-Jul-2021

- **DRUG ACTION** Teduglutide is an analogue of human glucagon-like peptide-2 (GLP-2), which preserves mucosal integrity by promoting growth and repair of the intestine.

- **INDICATIONS AND DOSE**

Short bowel syndrome (initiated under specialist supervision)

- ▸ BY SUBCUTANEOUS INJECTION
- ▸ Child 1–17 years: 0.05 mg/kg once daily, dose to be administered to alternating quadrants of the abdomen; alternatively the thigh can be used, for optimal injection volume per body weight and when to review treatment, consult product literature

- **CONTRA-INDICATIONS** Active or suspected malignancy · history of gastro-intestinal malignancy (in previous 5 years)
- **CAUTIONS** Abrupt withdrawal of parenteral support (reduce gradually with concomitant monitoring of fluid status) · cardiac insufficiency · cardiovascular disease · colo-rectal polyps · hypertension

CAUTIONS, FURTHER INFORMATION

- Colo-rectal polyps Manufacturer advises faecal occult blood testing before initiation of treatment and yearly thereafter; colonoscopy or sigmoidoscopy should be performed if unexplained blood in stool. Manufacturer also advises colonoscopy or sigmoidoscopy after 1 year of treatment and then every 5 years thereafter.

- **SIDE-EFFECTS**
- **Common or very common** Anxiety · appetite decreased · congestive heart failure · cough · dyspnoea · fluid imbalance · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal stoma complication · headache · influenza like illness · insomnia · nausea · pancreatitis · peripheral oedema · respiratory tract infection · vomiting
- **Uncommon** Syncope

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises caution in patients with tetracycline hypersensitivity.
- **PREGNANCY** EvGr Specialist sources indicate use if necessary—no human data available. D
- **BREAST FEEDING** Manufacturer advises avoid—toxicity in *animal* studies.
- **RENAL IMPAIRMENT**
  Dose adjustments EvGr Use half the daily dose if creatinine clearance is less than 50 mL/minute, M see p. 15.
- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment.
- **TREATMENT CESSATION** Caution when discontinuing treatment—risk of dehydration.
- **PATIENT AND CARER ADVICE** Patients with cardiovascular disease should seek medical attention if they notice sudden weight gain, swollen ankles or dyspnoea—may indicate increased fluid absorption.

Other drugs used for Bowel cleansing Bisacodyl, p. 47 · Docusate sodium, p. 47 · Magnesium sulfate, p. 682

DIAGNOSTIC AGENTS › RADIOGRAPHIC CONTRAST MEDIA

Meglumine amidotrizoate with sodium amidotrizoate

05-Oct-2021

(Diatrizoates)

- **DRUG ACTION** Meglumine amidotrizoate with sodium amidotrizoate is a radiological contrast medium with high osmolality.

- **INDICATIONS AND DOSE**

Uncomplicated meconium ileus

- BY RECTUM
  - Neonate: 15–30 mL for 1 dose.

Distal intestinal obstruction syndrome in children with cystic fibrosis

- BY MOUTH, OR BY RECTUM
  - Child 1-23 months: 15–30 mL for 1 dose
  - Child (body-weight 15-25 kg): 50 mL for 1 dose
  - Child (body-weight 26 kg and above): 100 mL for 1 dose

Radiological investigations

- Child: Dose to be recommended by radiologist

- **UNLICENSED USE** Not licensed for use in distal intestinal obstruction syndrome.
- **CONTRA-INDICATIONS** Hyperthyroidism
- **CAUTIONS** Asthma · benign nodular goitre · dehydration · electrolyte disturbance (correct first) · enteritis · history of allergy · in children with oesophageal fistulae (aspiration may lead to pulmonary oedema) · latent hyperthyroidism · risk of anaphylactoid reactions increased by concomitant administration of beta-blockers
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Abdominal pain · cardiac arrest · consciousness impaired · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · face oedema · fever · fluid imbalance · gastrointestinal disorders · headache · hyperhidrosis · hypersensitivity · hyperthyroidism · hypotension · nausea · pneumonia aspiration · pulmonary oedema · respiratory disorders · shock · skin reactions · tachycardia · toxic epidermal necrolysis · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Oral blistering

- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated if hypersensitivity to iodine. M
- **PREGNANCY** Manufacturer advises caution.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** Expert sources advise intravenous prehydration is essential in neonates and infants. Fluid intake should be encouraged for 3 hours after administration. *By mouth*, for child bodyweight 25 kg and under, expert sources advise dilute *Gastrografin*® with 3 times its volume of water or fruit juice; for child bodyweight over 25 kg, dilute *Gastrografin*® with twice its volume of water or fruit juice. *By rectum*, administration must be carried out slowly under radiological supervision to ensure required site is reached. For child under 5 years, expert sources advise dilute *Gastrografin*® with 5 times its volume of water; for child over 5 years dilute *Gastrografin*® with 4 times its volume of water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Disodium edetate

- **Gastrografin** (Bayer Plc)
  Sodium amidotrizoate 100 mg per 1 ml, Meglumine amidotrizoate 660 mg per 1 ml Gastrografin oral solution sugar-free | 1000 ml [P] £175.00 DT = £175.00

LAXATIVES › OSMOTIC LAXATIVES

Citric acid with magnesium carbonate

19-Aug-2021

(Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**

Bowel evacuation for surgery, colonoscopy or radiological examination

- BY MOUTH
- Child 5–9 years: One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure
- Child 10–17 years: 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure

- **CONTRA-INDICATIONS** Acute intestinal or gastric ulceration · acute severe colitis · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon
- **CAUTIONS** Debilitated · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · patients with fluid and electrolyte disturbances

  CAUTIONS, FURTHER INFORMATION Adequate hydration should be maintained during treatment.
- **INTERACTIONS** → Appendix 1: bowel cleansing preparations
- **SIDE-EFFECTS**
- **Common or very common** Gastrointestinal discomfort · nausea · vomiting
- **Uncommon** Dehydration · dizziness · electrolyte imbalance · headache

  SIDE-EFFECTS, FURTHER INFORMATION Abdominal pain is usually transient and can be reduced by taking preparation more slowly.
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution.
- **RENAL IMPAIRMENT** [EvGr] Caution in mild to moderate impairment; avoid in severe impairment (risk of hypermagnesaemia). ◈
- **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises one sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.
- **PRESCRIBING AND DISPENSING INFORMATION** Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate with 118 mmol Mg^{2+}.

  Flavours of oral powders may include lemon and lime.
- **PATIENT AND CARER ADVICE** Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber's advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Effervescent powder

CAUTIONARY AND ADVISORY LABELS 13, 10

ELECTROLYTES: May contain Magnesium

- **Citramag** (Cambridge Healthcare Supplies Ltd)
  Magnesium carbonate heavy 11.57 gram, Citric acid anhydrous 17.79 gram Citramag effervescent powder sachets sugar-free | 10 sachet [P] £20.50 DT = £20.50

Macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride

05-May-2021

(Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**

Bowel cleansing before radiological examination, colonoscopy, or surgery

- INITIALLY BY MOUTH
- Child 12–17 years: Initially 2 litres daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively (by mouth) initially 250 mL every 10–15 minutes, reconstituted solution to be administered, alternatively (by nasogastric tube) initially 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed

Distal intestinal obstruction syndrome

- BY MOUTH, OR BY NASOGASTRIC TUBE, OR BY GASTROSTOMY TUBE
- Child 1–17 years: 10 mL/kilogram/hour for 30 minutes, then increased to 20 mL/kilogram/hour for 30 minutes, then increased if tolerated to 25 mL/kilogram/hour, max. 100 mL/kg (or 4 litres) over 4 hours, repeat 4 hour treatment if necessary

- **UNLICENSED USE** *Klean-Prep*® not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: POLYETHYLENE GLYCOL (PEG) LAXATIVES AND STARCH-BASED THICKENERS: POTENTIAL INTERACTIVE EFFECT WHEN MIXED, LEADING TO AN INCREASED RISK OF ASPIRATION (APRIL 2021)

Addition of a macrogol (PEG)-based laxative to a liquid that has been thickened with a starch-based thickener may counteract the thickening action, resulting in a thin watery liquid that, when swallowed, increases the risk of potentially fatal aspiration in patients with dysphagia. Healthcare professionals are advised to avoid directly mixing macrogol-based laxatives with starch-based thickeners, especially for patients with dysphagia who are considered at risk of aspiration.

- **CONTRA-INDICATIONS** Acute severe colitis · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon
- **CAUTIONS** Colitis · debilitated patients · fluid and electrolyte disturbances · heart failure (avoid if moderate to severe) · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · impaired gag reflex or possibility of regurgitation or aspiration
- **INTERACTIONS** → Appendix 1: bowel cleansing preparations
- **SIDE-EFFECTS** Angioedema · arrhythmia · chills · confusion · dehydration · dizziness · dyspnoea · electrolyte imbalance

· fever · flatulence · gastrointestinal discomfort · headache · malaise · nausea · palpitations · seizure · skin reactions · thirst · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

- **PREGNANCY** Manufacturers advise use only if essential—no information available.
- **BREAST FEEDING** Manufacturers advise use only if essential—no information available.
- **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.
- **DIRECTIONS FOR ADMINISTRATION** EvGr 1 sachet should be reconstituted with 1 litre of water. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours. M
- **PRESCRIBING AND DISPENSING INFORMATION** Each *Klean-Prep*® sachet provides Na^+ 125 mmol, K^+ 10 mmol, Cl^- 35 mmol and HCO^{3-} 20mmol when reconstituted with 1 litre of water.
- **PATIENT AND CARER ADVICE** Solid food should not be taken for 2 hours before starting treatment. Adequate hydration should be maintained during treatment. Treatment can be stopped if bowel motions become watery and clear.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

LAXATIVES › STIMULANT LAXATIVES

Magnesium citrate with sodium picosulfate

19-Aug-2021

(Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**

PICOLAX® SACHETS

Bowel evacuation on day before radiological procedure, endoscopy, or surgery

- BY MOUTH
- Child 1 year: 0.25 sachet taken before 8 a.m, then 0.25 sachet after 6–8 hours
- Child 2–3 years: 0.5 sachet taken before 8 a.m, then 0.5 sachet after 6–8 hours
- Child 4–8 years: 1 sachet taken before 8 a.m, then 0.5 sachet after 6–8 hours
- Child 9–17 years: 1 sachet taken before 8 a.m, then 1 sachet after 6–8 hours

PHARMACOKINETICS

- For *Picolax*®: Acts within 3 hours of first dose.

- **CONTRA-INDICATIONS** Acute severe colitis · ascites · congestive cardiac failure · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · gastro-intestinal ulceration · toxic megacolon
- **CAUTIONS** Cardiac disease · children · colitis · debilitated patients · fluid and electrolyte disturbances (avoid in severe dehydration or hypermagnesaemia) · hypovolaemia (should be corrected before administration) · recent gastro-intestinal surgery
- **INTERACTIONS** → Appendix 1: bowel cleansing preparations
- **SIDE-EFFECTS**
  - **Common or very common** Gastrointestinal discomfort · headache · nausea
  - **Uncommon** Confusion · electrolyte imbalance · gastrointestinal disorders · seizures · skin reactions · vomiting
- **PREGNANCY** Caution.
- **BREAST FEEDING** Caution.
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** EvGr Caution in mild to moderate impairment; avoid in severe impairment (risk of hypermagnesaemia). M
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises one sachet of sodium picosulfate with magnesium citrate powder should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include lemon.

  PICOLAX® SACHETS One reconstituted sachet contains K^+ 5 mmol and Mg^{2+} 87 mmol.
- **PATIENT AND CARER ADVICE** Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment. Patients and carers should be given advice on how to administer oral powder; they should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

2.2 Constipation

Constipation

06-Jun-2017

Description of condition

Constipation is defaecation that is unsatisfactory because of infrequent stools, difficult stool passage, or seemingly incomplete defaecation. It can occur at any age and is common in childhood.

Overview

Before prescribing laxatives it is important to be sure that the child *is* constipated and that the constipation is not secondary to an underlying undiagnosed complaint. Early identification of constipation and effective treatment can improve outcomes for children. Without early diagnosis and treatment, an acute episode of constipation can lead to anal fissure and become chronic. In children with secondary constipation caused by a drug, the drug should be reviewed.

Laxatives

Bulk-forming laxatives

Bulk-forming laxatives include bran, ispaghula husk p. 43, methylcellulose and sterculia p. 43. They are of particular value in children with small hard stools if fibre cannot be increased in the diet. EvGr They relieve constipation by

increasing faecal mass, which stimulates peristalsis; children and their carers should be advised that the full effect may take some days to develop. Adequate fluid intake must be maintained to avoid intestinal obstruction, though this may be difficult for children. A

Methylcellulose, ispaghula husk and sterculia may be used in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

Stimulant laxatives

Stimulant laxatives include bisacodyl p. 47, sodium picosulfate p. 51, and members of the anthraquinone group, senna p. 49, co-danthramer p. 48 and co-danthrusate p. 49. Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction.

The use of co-danthramer and co-danthrusate is limited to constipation in terminally ill patients because of potential carcinogenicity (based on animal studies) and evidence of genotoxicity.

Docusate sodium p. 47 is believed to act as both a stimulant laxative and as a faecal softener (below). Glycerol suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

Faecal softeners

Faecal softeners are claimed to act by decreasing surface tension and increasing penetration of intestinal fluid into the faecal mass. Docusate sodium, and glycerol suppositories p. 49 have softening properties. Enemas containing arachis oil p. 47 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement. Liquid paraffin has also been used as a lubricant for the passage of stool but manufacturer advises that it should be used with caution because of its adverse effects, which include anal seepage and the risks of granulomatous disease of the gastro-intestinal tract or of lipoid pneumonia on aspiration.

Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with. Lactulose p. 44 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy. Macrogols (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 44) are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Macrogols are an effective non-traumatic means of evacuation in children with faecal impaction and can be used in the long-term management of chronic constipation.

Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents; examples include macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride p. 40, citric acid with magnesium carbonate p. 40, magnesium citrate with sodium picosulfate p. 41 and sodium acid phosphate with sodium phosphate p. 46. Bowel cleansing preparations are not treatments for constipation.

Management

EvGr The first-line treatment for children with constipation requires the use of a laxative in combination with dietary modification or with behavioural interventions. Diet modification alone is not recommended as first-line treatment.

In children, an increase in dietary fibre, adequate fluid intake and exercise is advised. Diet should be balanced and contain fruits, vegetables, high-fibre bread, baked beans and wholegrain breakfast cereals. Unprocessed bran (which may cause bloating and flatulence and reduces the absorption of micronutrients) is **not** recommended.

If faecal impaction is not present (or has been treated), the child should be treated promptly with a laxative. A macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is preferred as first-line management. If the response is inadequate, add a stimulant laxative or change to a stimulant laxative if the first-line therapy is not tolerated. If stools remain hard, lactulose or another laxative with softening effects, such as docusate sodium can be added.

In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

A shorter duration of laxative treatment may be possible in some children with a short history of constipation.

Laxatives should be administered at a time that produces an effect that is likely to fit in with the child's toilet routine. A

Faecal impaction

EvGr Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing a macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is used to clear faecal mass and to establish and maintain soft well-formed stools, using an escalating dose regimen depending on symptoms and response. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added or if stools are hard, used in combination with an osmotic laxative such as lactulose. Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

Suppositories and enemas should not be used in primary care unless all oral medications have failed and preferably only then following specialist advice. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate enema p. 46 can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A sodium acid phosphate with sodium phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid. Children undergoing disimpaction should be reviewed within one week. Maintenance treatment should be started as soon as the bowel is disimpacted. A

Ispaghula husk

27-Jul-2020

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

- **INDICATIONS AND DOSE**

Constipation

► BY MOUTH

- Child 1 month–5 years: 2.5–5 mL twice daily, dose to be taken only when prescribed by a doctor, as half or whole level spoonful in water, preferably after meals, morning and evening
- Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
- Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening

Constipation (dose approved for use by community practitioner nurse prescribers)

► BY MOUTH

- Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
- Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening

DOSE EQUIVALENCE AND CONVERSION

- 1 sachet equivalent to 2 level 5 ml spoonsful.

- **CONTRA-INDICATIONS** Colonic atony · faecal impaction · intestinal obstruction · reduced gut motility · sudden change in bowel habit that has persisted more than two weeks · undiagnosed rectal bleeding
- **CAUTIONS** Adequate fluid intake should be maintained to avoid oesophageal or intestinal obstruction
- **SIDE-EFFECTS** Abdominal distension · bronchospasm · conjunctivitis · gastrointestinal disorders · hypersensitivity · rhinitis · skin reactions
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises dose to be taken with at least 150 mL liquid.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of soluble granules formulations may include plain, lemon, or orange.
- **HANDLING AND STORAGE** Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.
- **PATIENT AND CARER ADVICE** Manufacturer advises that preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer ispaghula husk.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride

10-Nov-2021

- **INDICATIONS AND DOSE**

Chronic constipation (dose for 'paediatric' sachets) | Prevention of faecal impaction (dose for 'paediatric' sachets)
- BY MOUTH
- Child 1–11 months: 0.5–1 sachet daily
- Child 12–23 months: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
- Child 2–5 years: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
- Child 6–11 years: 2 sachets daily, adjust dose to produce regular soft stools; maximum 4 sachets per day

Faecal impaction (dose for 'paediatric' sachets)
- BY MOUTH
- Child 1–11 months: 0.5–1 sachet daily
- Child 12–23 months: 2 sachets on first day, then 4 sachets daily for 2 days, then 6 sachets daily for 2 days, then 8 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy
- Child 2–4 years: 2 sachets on first day, then 4 sachets daily for 2 days, then 6 sachets daily for 2 days, then 8 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy
- Child 5–11 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy; maximum 12 sachets per day

Chronic constipation (dose for 'half-strength' sachets)
- BY MOUTH
- Child 12–17 years: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily

Faecal impaction (dose for 'half-strength' sachets)
- BY MOUTH
- Child 12–17 years: 8 sachets on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 16 sachets per day

Chronic constipation (dose for 'full-strength' sachets)
- BY MOUTH
- Child 12–17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

Faecal impaction (dose for 'full-strength' sachets)

- BY MOUTH
- Child 12–17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

DOSE EQUIVALENCE AND CONVERSION

- Each 'paediatric' sachet contains 6.563 g of macrogol 3350; each 'half-strength' sachet contains 6.563 g of macrogol 3350; each 'full-strength' sachet contains 13.125 g of macrogol 3350.

MOVICOL ® READY TO TAKE SACHETS

Chronic constipation

- BY MOUTH
- Child 12–17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

Faecal impaction

- BY MOUTH
- Child 12–17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period; patients should also take an additional 1 litre of fluid daily, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

MOVICOL ® LIQUID

Chronic constipation

- BY MOUTH
- Child 12–17 years: 25 mL 1–3 times a day usually for up to 2 weeks; maintenance 25 mL 1–2 times a day

- **UNLICENSED USE** Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride may be used as detailed below, although these situations are considered outside the scope of its licence:
  - EvGr chronic constipation/prevention of faecal impaction in children aged under 2 years;
  - dose for chronic constipation/prevention of faecal impaction in children aged 6 years;
  - faecal impaction in children aged under 5 years;
  - dose titration schedule for faecal impaction in children aged 12–17 years A.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: POLYETHYLENE GLYCOL (PEG) LAXATIVES AND STARCH-BASED THICKENERS: POTENTIAL INTERACTIVE EFFECT WHEN MIXED, LEADING TO AN INCREASED RISK OF ASPIRATION (APRIL 2021)

Addition of a macrogol (PEG)-based laxative to a liquid that has been thickened with a starch-based thickener may counteract the thickening action, resulting in a thin watery liquid that, when swallowed, increases the risk of potentially fatal aspiration in patients with dysphagia. Healthcare professionals are advised to avoid directly mixing macrogol-based laxatives with starch-based thickeners, especially for patients with dysphagia who are considered at risk of aspiration.

- **CONTRA-INDICATIONS** Intestinal obstruction · intestinal perforation · paralytic ileus · severe inflammatory conditions of the intestinal tract (including Crohn's disease, ulcerative colitis and toxic megacolon) · use of 'paediatric' sachets for faecal impaction in impaired cardiovascular function (no information available)
- **CAUTIONS** Cardiovascular impairment (should not take more than 2 'full-strength' sachets or 4 'half-strength' sachets in any one hour) · impaired consciousness (with high doses) · impaired gag reflex (with high doses) · reflux oesophagitis (with high doses)
- **SIDE-EFFECTS** Electrolyte imbalance (discontinue if symptoms occur) · flatulence · gastrointestinal discomfort · nausea · vomiting
- **PREGNANCY** Manufacturers advise may be used—limited data available.
- **RENAL IMPAIRMENT** Manufacturers advise avoid use of 'paediatric' sachets for faecal impaction—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturers advise dissolve contents of each 'half-strength' sachet of oral powder in 62.5 mL of water, and each 'full-strength' sachet of oral powder in 125 mL of water; after reconstitution the solution should be kept in a refrigerator—for further information consult product literature.

  Manufacturers advise dissolve contents of each 'paediatric' sachet of oral powder in 62.5 mL of water; after reconstitution the solution should be kept in a refrigerator—for further information consult product literature.

  MOVICOL ® LIQUID Manufacturer advises dilute 25 mL of oral concentrate with 100 mL of water; after dilution the solution should be discarded if unused after 24 hours.
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on how to take the oral powder and oral solution.

  Medicines for Children leaflet: Movicol for constipation www.medicinesforchildren.org.uk/medicines/movicol-for-constipation/

  VISTAPREP ® ORAL POWDER Manufacturer advises treatment can be stopped if bowel motions become watery and clear.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Magnesium hydroxide

01-Dec-2021

INDICATIONS AND DOSE

Constipation

BY MOUTH
- Child 3–11 years: 5–10 mL as required, dose to be given mixed with water at bedtime
- Child 12–17 years: 30–45 mL as required, dose to be given mixed with water at bedtime

- **CONTRA-INDICATIONS** Acute gastro-intestinal conditions
- **CAUTIONS** Debilitated patients
- **INTERACTIONS** → Appendix 1: magnesium
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** [EvGr] Caution (risk of hypermagnesaemia); avoid in severe renal failure. Ⓜ
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension
- **Magnesium hydroxide (Non-proprietary)**
  Magnesium hydroxide 79 mg per 1 ml Magnesium hydroxide 7.45-8.35% oral suspension BP | 500 ml [GSL] £5.31
  Magnesium hydroxide 80 mg per 1 ml Magnesium hydroxide 8% oral suspension | 500 ml [GSL] £8.05 DT = £8.05
- Brands may include Phillips' Milk of Magnesia

Sodium acid phosphate with sodium phosphate

18-Oct-2021

INDICATIONS AND DOSE

Constipation (using Phosphates Enema BP Formula B) | Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)

BY RECTUM
- Child 3–6 years: 45–65 mL once daily
- Child 7–11 years: 65–100 mL once daily
- Child 12–17 years: 100–128 mL once daily

Constipation, using Phosphates Enema BP Formula B (dose approved for use by community practitioner nurse prescribers)

BY RECTUM
- Child 3–17 years: Reduced according to body-weight

Constipation, using Phosphates Enema (Cleen Ready-to-Use) (dose approved for use by community practitioner nurse prescribers)

BY RECTUM
- Child 3–11 years: On doctor's advice only
- Child 12–17 years: 118 mL

FLEET® READY-TO-USE ENEMA

Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery

BY RECTUM
- Child 3–6 years: 40–60 mL once daily
- Child 7–11 years: 60–90 mL once daily
- Child 12–17 years: 90–118 mL once daily

- **CONTRA-INDICATIONS** Conditions associated with increased colonic absorption · gastro-intestinal obstruction · inflammatory bowel disease
- **CAUTIONS** Ascites · congestive heart failure · debilitated patients · fluid and electrolyte disturbances · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: bowel cleansing preparations
- **SIDE-EFFECTS**
  - **Rare or very rare** Chills · dehydration · electrolyte imbalance · gastrointestinal discomfort · metabolic acidosis · nausea · pain · vomiting
- **RENAL IMPAIRMENT** [EvGr] Caution; avoid in significant impairment. Ⓜ
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Enema
- **Sodium acid phosphate with sodium phosphate (Non-proprietary)**
  Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml, Sodium dihydrogen phosphate dihydrate 100 mg per 1 ml Phosphates enema (Formula B) 128ml long tube | 1 enema [P] £30.78 DT = £30.78

LAXATIVES › SOFTENING LAXATIVES

Arachis oil

18-Nov-2020

- **INDICATIONS AND DOSE**

To soften impacted faeces

- BY RECTUM
- Child 3–6 years (under close medical supervision): 45–65 mL as required
- Child 7–11 years (under close medical supervision): 65–100 mL as required
- Child 12–17 years (under close medical supervision): 100–130 mL as required

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CONTRA-INDICATIONS** Inflammatory bowel disease (except under medical supervision)
- **CAUTIONS** Hypersensitivity to soya · intestinal obstruction
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated if history of hypersensitivity to arachis oil or peanuts. M
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises warm enema in warm water before use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Enema

- **Arachis oil (Non-proprietary)**
  Arachis oil 1 ml per 1 ml Arachis oil 130ml enema | 1 enema P £52.06 DT = £52.06

Docusate sodium

30-Jul-2020

(Dioctyl sodium sulphosuccinate)

- **INDICATIONS AND DOSE**

Chronic constipation

- BY MOUTH
- Child 6–23 months: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
- Child 2–11 years: 12.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
- Child 12–17 years: Up to 500 mg daily in divided doses, adjusted according to response
- BY RECTUM
- Child 12–17 years: 120 mg for 1 dose

Adjunct in abdominal radiological procedures

- BY MOUTH
- Child 12–17 years: 400 mg, to be administered with barium meal
- BY RECTUM
- Child 12–17 years: 120 mg for 1 dose

PHARMACOKINETICS

- Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

- **UNLICENSED USE** *Adult oral solution and capsules* not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS** Avoid in intestinal obstruction
- **CAUTIONS** Do not give with liquid paraffin · excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · rectal preparations not indicated if haemorrhoids or anal fissure
- **INTERACTIONS** → Appendix 1: docusates
- **SIDE-EFFECTS**
- **Rare or very rare**
- With oral use Abdominal cramps · nausea · rash
- **PREGNANCY** Not known to be harmful—manufacturer advises caution.
- **BREAST FEEDING** Manufacturer advises caution—present in milk following oral administration. Rectal administration not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** For administration *by mouth*, manufacturer advises solution may be mixed with milk or squash.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- **Docusate sodium (Non-proprietary)**

LAXATIVES › STIMULANT LAXATIVES

Bisacodyl

10-Sep-2020

- **INDICATIONS AND DOSE**

Constipation

- BY MOUTH
- Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night
- BY RECTUM
- Child 2–17 years: 5–10 mg once daily, adjusted according to response

continued →

Bowel clearance before radiological procedures and surgery

- INITIALLY BY MOUTH
- Child 4–9 years: 5 mg once daily for 2 days before procedure, dose to be taken at bedtime and (by rectum) 5 mg if required, dose to be administered 1 hour before procedure
- Child 10–17 years: 10 mg once daily for 2 days before procedure, dose to be taken at bedtime and (by rectum) 10 mg if required, dose to be administered 1 hour before procedure

Constipation (dose approved for use by community practitioner nurse prescribers)

- BY MOUTH
- Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night (on doctor's advice only)
- BY RECTUM
- Child 4–9 years: 5 mg once daily, adjusted according to response
- Child 10–17 years: 10 mg once daily, dose to be taken in the morning

PHARMACOKINETICS

- Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

● **UNLICENSED USE**

- With rectal use EvGr Bisacodyl may be used in children aged under 10 years for the management of constipation, A but the higher dose option is not licensed in this age group.
- With oral use EvGr Bisacodyl may be used in children for the management of constipation, A but the higher dose option is not licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: STIMULANT LAXATIVES (BISACODYL, SENNA AND SENNOSIDES, SODIUM PICOSULFATE) AVAILABLE OVER-THE-COUNTER: NEW MEASURES TO SUPPORT SAFE USE (AUGUST 2020)

Following a national safety review and concerns over misuse and abuse, the MHRA has introduced new pack size restrictions, revised recommended ages for use, and new safety warnings for over-the-counter stimulant laxatives (administered orally and rectally). Patients should be advised that dietary and lifestyle measures should be used first-line for relieving short-term occasional constipation, and that stimulant laxatives should only be used if these measures and other laxatives (bulk-forming and osmotic) are ineffective.

Smaller packs will remain available for general sale for the treatment of short-term, occasional constipation in adults only, and will be limited to a pack size of two short treatment courses. Stimulant laxatives should not be used in children under 12 years of age without advice from a prescriber; in children aged 12 to 17 years, products can be supplied under the supervision of a pharmacist.

● **CONTRA-INDICATIONS** Acute abdominal conditions · acute inflammatory bowel disease · intestinal obstruction · severe dehydration

● **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · prolonged use may harm intestinal function · risk of electrolyte imbalance with prolonged use

● **SIDE-EFFECTS**

- **Common or very common** Gastrointestinal discomfort · nausea
- **Uncommon** Haematochezia · vomiting
- **Rare or very rare** Angioedema · colitis · dehydration

● **PREGNANCY** May be suitable for constipation in pregnancy, if a stimulant effect is necessary.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, suppository

Gastro-resistant tablet

Co-danthramer

16-Mar-2020

● **INDICATIONS AND DOSE**

Constipation in palliative care (standard strength capsules)

- BY MOUTH USING CAPSULES
- Child 6–11 years: 1 capsule once daily, dose should be taken at night
- Child 12–17 years: 1–2 capsules once daily, dose should be taken at night

Constipation in palliative care (strong capsules)

- BY MOUTH USING CAPSULES
- Child 12–17 years: 1–2 capsules once daily, dose should be given at night

Constipation in palliative care (standard strength suspension)

- BY MOUTH USING ORAL SUSPENSION
- Child 2–11 years: 2.5–5 mL once daily, dose should be taken at night
- Child 12–17 years: 5–10 mL once daily, dose should be taken at night

Constipation in palliative care (strong suspension)

- BY MOUTH USING ORAL SUSPENSION
- Child 12–17 years: 5 mL once daily, dose should be taken at night

DOSE EQUIVALENCE AND CONVERSION

- Co-danthramer (standard strength) capsules contain dantron 25 mg with poloxamer '188' 200 mg per capsule.
- Co-danthramer (standard strength) oral suspension contains dantron 25 mg with poloxamer '188' 200 mg per 5 mL.
- Co-danthramer **strong** capsules contain dantron 37.5 mg with poloxamer '188' 500 mg.
- Co-danthramer **strong** oral suspension contains dantron 75 mg with poloxamer '188' 1 g per 5 mL.
- Co-danthramer suspension 5 mL = one co-danthramer capsule, **but** strong co-danthramer suspension 5 mL = two strong co-danthramer capsules.

● **CONTRA-INDICATIONS** Acute abdominal conditions · acute inflammatory bowel disease · intestinal obstruction · severe dehydration

● **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation · *rodent* studies indicate potential carcinogenic risk

CAUTIONS, FURTHER INFORMATION

- Local irritation Avoid prolonged contact with skin (incontinent patients or infants wearing nappies—risk of irritation and excoriation).

- **SIDE-EFFECTS** Abdominal cramps · asthenia · gastrointestinal disorders · hypermagnesaemia · skin reactions · urine discolouration
- **PREGNANCY** Manufacturers advise avoid—limited information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of co-danthramer in palliative care, see www.medicinescomplete.com/#/content/palliative/stimulant-laxatives.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Co-danthrusate

16-Mar-2020

- **INDICATIONS AND DOSE**

Constipation in palliative care

- BY MOUTH USING ORAL SUSPENSION
- Child 6-11 years: 5 mL once daily, to be taken at night
- Child 12-17 years: 5–15 mL once daily, to be taken at night

DOSE EQUIVALENCE AND CONVERSION

- Co-danthrusate suspension contains dantron 50 mg and docusate sodium 60 mg per 5 mL.

- **CONTRA-INDICATIONS** Acute abdominal conditions · acute inflammatory bowel disease · intestinal obstruction · severe dehydration
- **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation · *rodent* studies indicate potential carcinogenic risk

CAUTIONS, FURTHER INFORMATION

- Local irritation Avoid prolonged contact with skin (incontinent patients—risk of irritation and excoriation).

- **INTERACTIONS** → Appendix 1: docusates
- **SIDE-EFFECTS** Gastrointestinal disorders · skin reactions · urine discolouration
- **PREGNANCY** Manufacturers advise avoid—limited information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Senna

11-Nov-2021

- **DRUG ACTION** Senna is a stimulant laxative. After metabolism of sennosides in the gut the anthrone component stimulates peristalsis thereby increasing the motility of the large intestine.

- **INDICATIONS AND DOSE**

Constipation

- BY MOUTH USING TABLETS
- Child 2-3 years: 3.75–15 mg once daily, adjusted according to response
- Child 4-5 years: 3.75–30 mg once daily, adjusted according to response
- Child 6-17 years: 7.5–30 mg once daily, adjusted according to response
- BY MOUTH USING SYRUP
- Child 1 month-3 years: 3.75–15 mg once daily, adjusted according to response
- Child 4-17 years: 3.75–30 mg once daily, adjusted according to response

Constipation (dose approved for use by community practitioner nurse prescribers)

- BY MOUTH USING TABLETS
- Child 6-17 years: 7.5–30 mg once daily, adjusted according to response
- BY MOUTH USING SYRUP
- Child 2-3 years: 3.75–15 mg once daily, adjusted according to response
- Child 4-17 years: 3.75–30 mg once daily, adjusted according to response

PHARMACOKINETICS

- Onset of action 8–12 hours.

- **UNLICENSED USE** *Tablets* not licensed for use in children under 6 years. *Syrup* not licensed for use in children under 2 years.

  Doses in BNF Publications adhere to national guidelines and may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: STIMULANT LAXATIVES (BISACODYL, SENNA AND SENNOSIDES, SODIUM PICOSULFATE) AVAILABLE OVER-THE-COUNTER: NEW MEASURES TO SUPPORT SAFE USE (AUGUST 2020)

Following a national safety review and concerns over misuse and abuse, the MHRA has introduced new pack size restrictions, revised recommended ages for use, and new safety warnings for over-the-counter stimulant laxatives (administered orally and rectally). Patients should be advised that dietary and lifestyle measures should be used first-line for relieving short-term occasional constipation, and that stimulant laxatives should only be used if these measures and other laxatives (bulk-forming and osmotic) are ineffective.

Smaller packs will remain available for general sale for the treatment of short-term, occasional constipation in adults only, and will be limited to a pack size of two short treatment courses. Stimulant laxatives should not be used in children under 12 years of age without advice from a prescriber; in children aged 12 to 17 years, products can be supplied under the supervision of a pharmacist.

- **CONTRA-INDICATIONS** Atony · intestinal obstruction · undiagnosed abdominal pain
- **SIDE-EFFECTS** Albuminuria · diarrhoea · electrolyte imbalance · fluid imbalance · gastrointestinal discomfort · haematuria · pseudomelanosis coli · skin reactions · urine discolouration

  SIDE-EFFECTS, FURTHER INFORMATION Prolonged or excessive use can cause hypokalaemia.
- **PREGNANCY** EvGr Specialist sources indicate suitable for use in pregnancy. Ⓓ
- **BREAST FEEDING** EvGr Specialist sources indicate suitable for use in breast-feeding in infants over 1 month. Ⓓ
- **PATIENT AND CARER ADVICE**

  Medicines for Children leaflet: Senna for constipation www.medicinesforchildren.org.uk/medicines/senna-for-constipation/

Senna with ispaghula husk

11-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, senna p. 49, ispaghula husk p. 43.

- **INDICATIONS AND DOSE**

Constipation

- BY MOUTH
- Child 12–17 years: 5–10 g once daily, to be taken at night, up to 2–3 times a week

DOSE EQUIVALENCE AND CONVERSION

- 5 g equivalent to one level spoonful of granules.

- **PREGNANCY** Manufacturer advises avoid during first trimester. To be used only intermittently and only if dietary and lifestyle changes fail.
- **DIRECTIONS FOR ADMINISTRATION** EvGr Take at night with at least 150 mL liquid. Ⓜ

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Granules

CAUTIONARY AND ADVISORY LABELS 25
EXCIPIENTS: May contain Sucrose

- **Manevac** (Viatris UK Healthcare Ltd)

  Senna fruit 124 mg per 1 gram, Ispaghula 542 mg per 1 gram Manevac granules | 400 gram PoM £9.50

Sodium acid phosphate with sodium bicarbonate

03-Dec-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium bicarbonate p. 669.

- **INDICATIONS AND DOSE**

LECICARBON A®

Constipation | Bowel evacuation [before diagnostic or therapeutic procedures in the rectum]

- BY RECTUM
- Child 12–17 years: 1 suppository as required, dose may be repeated after 30–60 minutes

PHARMACOKINETICS

- Onset of action 15–30 minutes.

LECICARBON C®

Constipation | Bowel evacuation [before diagnostic or therapeutic procedures in the rectum]

- BY RECTUM
- Child 1–11 years: 1 suppository as required, dose may be repeated after 30–60 minutes

PHARMACOKINETICS

- Onset of action 15–30 minutes.

- **CONTRA-INDICATIONS** Anal and rectal region diseases (risk of excessive absorption of carbon dioxide, particularly in infants and children) · ileus · toxic megacolon (except with explicit permission of the physician)
- **INTERACTIONS** → Appendix 1: bowel cleansing preparations · sodium bicarbonate
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated in patients with peanut or soya hypersensitivity. Ⓜ
- **PREGNANCY** EvGr Use only if potential benefit outweighs risk—effect of the expanding volume of carbon dioxide may be negligible. Ⓜ
- **BREAST FEEDING** EvGr Suitable for use in breast-feeding—the developed carbon dioxide will not be excreted in milk. Ⓜ
- **DIRECTIONS FOR ADMINISTRATION** EvGr Moisten suppositories with water before insertion if needed. Ⓜ

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suppository

- **Lecicarbon A** (Aspire Pharma Ltd)

3 Diarrhoea

Diarrhoea (acute)

08-Mar-2022

Description of condition

Diarrhoea is the abnormal passing of loose or liquid stools, with increased frequency, increased volume, or both. Acute diarrhoea is that which lasts less than 14 days, but symptoms usually spontaneously resolve within 2–4 days. It can result from infection, as a side-effect of a drug, or as an acute symptom of a chronic gastro-intestinal disorder (such as Crohn's disease p. 28, Irritable bowel syndrome p. 37, or Ulcerative colitis p. 30). It may also occur when intestinal motility or morphology is altered.

Prompt investigation is required to identify or exclude any serious underlying cause if the child has any red flag symptoms as such unexplained weight loss, rectal bleeding, persistent diarrhoea, a systemic illness, has received recent hospital treatment or antibiotic treatment, or following foreign travel (other than to Western Europe, North America, Australia or New Zealand).

Aims of treatment

The priority in acute diarrhoea treatment, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion and the management of dehydration when it is present. This is particularly important in infants, when excessive water and electrolyte loss and dehydration can be life-threatening.

Treatment

Most episodes of acute diarrhoea will settle spontaneously without the need for any medical treatment. EvGr Oral rehydration therapy (ORT, such as disodium hydrogen citrate with glucose, potassium chloride and sodium chloride p. 675; potassium chloride with sodium chloride p. 672; potassium chloride with rice powder, sodium chloride and sodium citrate p. 675) is the mainstay of treatment to prevent or correct diarrhoeal dehydration and to maintain

the appropriate fluid intake once rehydration is achieved—see Fluids and electrolytes p. 666.

However, in children with severe dehydration and in those unable to drink, immediate admission to hospital and urgent replacement treatment with an intravenous rehydration fluid is recommended—see Fluids and electrolytes p. 666.

ORT is recommended for children at *increased risk of dehydration* and for those *with clinical dehydration* (including hypernatraemic dehydration). If the child is unable to drink the ORT, or vomits persistently, consider giving the solution via a nasogastric tube.

In infants, after rehydration, encourage breast-feeding, other milk feeds and fluid intake. In older children, after rehydration, give full-strength milk straight away, reintroduce the child's usual solid food, and avoid giving fruit juices and carbonated drinks until the diarrhoea has stopped.

In children with gastroenteritis, but *without clinical dehydration*, encourage fluid intake, continue breast-feeding and other milk feeds, and discourage the drinking of fruit juices and carbonated drinks.

In general, antidiarrhoeal drugs have no practical benefit for children with acute or persistent diarrhoea and their use is generally not recommended (side-effects include drowsiness, abdominal distension and ileus). Ⓐ

Racecadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea in children over 3 months; it should only be used when supportive measures, including oral rehydration, are insufficient to control the condition.

Antibacterial drugs for acute diarrhoea

EvGr Antibacterial treatment is **not** recommended *routinely* for children with acute diarrhoea. Antibacterial treatment is recommended in cases of extra-intestinal spread of bacterial infection; *Clostridioides difficile*-associated pseudomembranous colitis; giardiasis, dysenteric shigellosis, dysenteric amoebiasis, or cholera; in children under 6 months with salmonella gastroenteritis; in children who are malnourished or immunocompromised; and in children with suspected or confirmed septicaemia. For children who have recently been abroad, seek specialist advice about antibacterial therapy. Ⓐ For guidance on antibacterial treatment for some infections that cause acute diarrhoea, see Gastro-intestinal system infections, antibacterial therapy p. 342.

10-Nov-2021

- **INDICATIONS AND DOSE**

Symptomatic treatment of acute diarrhoea

- BY MOUTH
  - Child 4–7 years: 1 mg 3–4 times a day for up to 3 days only
  - Child 8–11 years: 2 mg 4 times a day for up to 5 days
  - Child 12–17 years: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

Chronic diarrhoea

- BY MOUTH
  - Child 1–11 months: 100–200 micrograms/kg twice daily, to be given 30 minutes before feeds; increased if necessary up to 2 mg/kg daily in divided doses
  - Child 1–11 years: 100–200 micrograms/kg 3–4 times a day (max. per dose 2 mg), increased if necessary up to

1.25 mg/kg daily in divided doses; maximum 16 mg per day
- Child 12–17 years: 2–4 mg 2–4 times a day; maximum 16 mg per day

- **UNLICENSED USE** Not licensed for use in children for chronic diarrhoea. *Capsules* not licensed for use in children under 8 years. *Syrup* not licensed for use in children under 4 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: REPORTS OF SERIOUS CARDIAC ADVERSE REACTIONS WITH HIGH DOSES OF LOPERAMIDE ASSOCIATED WITH ABUSE OR MISUSE (SEPTEMBER 2017)

Serious cardiovascular events (such as QT prolongation, torsades de pointes, and cardiac arrest), including fatalities, have been reported in association with large overdoses of loperamide.

Healthcare professionals are reminded that if symptoms of overdose occur, naloxone can be given as an antidote. The duration of action of loperamide is longer than that of naloxone (1–3 hours), so repeated treatment with naloxone might be indicated; patients should be monitored closely for at least 48 hours to detect possible CNS depression.

Pharmacists should remind patients not to take more than the recommended dose on the label.

- **CONTRA-INDICATIONS** Active ulcerative colitis · antibiotic-associated colitis · bacterial enterocolitis · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided
- **CAUTIONS** Not recommended for children under 12 years
- **INTERACTIONS** → Appendix 1: loperamide
- **SIDE-EFFECTS**
- **Common or very common** Gastrointestinal disorders · headache · nausea
- **Uncommon** Dizziness · drowsiness · dry mouth · gastrointestinal discomfort · skin reactions · vomiting
- **Rare or very rare** Angioedema · consciousness impaired · coordination abnormal · fatigue · miosis · muscle tone increased · severe cutaneous adverse reactions (SCARs) · urinary retention
- **PREGNANCY** Manufacturers advise avoid—no information available.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—risk of reduced first pass metabolism leading to central nervous system toxicity.

4 Exocrine pancreatic insufficiency

Exocrine pancreatic insufficiency

10-Jan-2022

Description of condition

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum.

The main clinical manifestations are maldigestion and malnutrition, associated with low circulating levels of micronutrients, fat-soluble vitamins and lipoproteins. Children also present with gastro-intestinal symptoms, such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from cystic fibrosis, coeliac disease, Zollinger-Ellison syndrome, and gastro-intestinal or pancreatic surgical resection.

Aims of treatment

The aim of treatment is to relieve gastro-intestinal symptoms and to achieve a normal nutritional status.

Drug treatment

EvGr Pancreatic enzyme replacement therapy with pancreatin p. 54 is the mainstay of treatment for children with exocrine pancreatic insufficiency. A

Pancreatin contains the three main groups of digestive enzymes: lipase, amylase and protease. These enzymes respectively digest fats, carbohydrates and proteins into their basic components so that they can be absorbed and

utilised by the body. EvGr Pancreatin should be administered with meals and snacks. The dose should be adjusted, as necessary, to the lowest effective dose according to the symptoms of maldigestion and malabsorption. A

Fibrosing colonopathy has been reported in children with cystic fibrosis taking high dose pancreatic enzyme replacement therapy (in excess of 10 000 units/kg/day of lipase). Possible risk factors are sex (boys are at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years. Manufacturers of *Pancrease HL*® and *Nutrizym* 22® recommend that the total dose of pancreatin used in patients with cystic fibrosis should not usually exceed 10 000 units/kg/day of lipase. Manufacturers recommend that if a patient taking pancreatin develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

There is limited evidence that acid suppression may improve the effectiveness of pancreatin. EvGr Acid-suppressing drugs (proton pump inhibitors or H_2-receptor antagonists) may be trialled in children who continue to experience symptoms despite high doses of pancreatin.

Levels of fat-soluble vitamins and micronutrients (such as zinc and selenium) should be routinely assessed and supplementation recommended whenever necessary. A

Preparation	**Protease units**	**Amylase units**	**Lipase units**
Creon® 25 000 capsule, e/c pellets	1000	18 000	25 000
Nutrizym 22® capsule, e/c minitablets	1100	19 800	22 000
Pancrease HL® capsule, e/c minitablets	1250	22 500	25 000

Non-drug treatment

EvGr Dietary advice should be provided. Food intake should be distributed between three main meals per day, and two or three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended. A

Medium-chain triglycerides (see MCT oil, in *Borderline substances*), which are directly absorbed by the intestinal mucosa, were thought to be useful in some children. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.

PANCREATIC ENZYMES

Pancreatin

11-Nov-2021

- **DRUG ACTION** Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

- **INDICATIONS AND DOSE**

CREON® 10000

Pancreatic insufficiency

- BY MOUTH
- Child: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON® 25000

Pancreatic insufficiency

- BY MOUTH
- Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON® 40000

Pancreatic insufficiency

- BY MOUTH
- Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON® MICRO

Pancreatic insufficiency

- BY MOUTH
- Neonate: Initially 100 mg, for administration advice, see *Directions for administration*.
- Child: Initially 100 mg, for administration advice, see *Directions for administration*

DOSE EQUIVALENCE AND CONVERSION

- For *Creon® Micro* : 100 mg granules = one measured scoopful (scoop supplied with product).

NUTRIZYM 22® GASTRO-RESISTANT CAPSULES

Pancreatic insufficiency

- BY MOUTH
- Child 15-17 years: Initially 1–2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water, or mixed with acidic fluid or soft food (then swallowed immediately without chewing)

PANCREASE HL®

Pancreatic insufficiency

- BY MOUTH
- Child 15-17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

PANCREX® V

Pancreatic insufficiency

- BY MOUTH
- Child 1-11 months: 1–2 capsules, contents of capsule to be mixed with feeds
- Child 1-17 years: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

PANCREX® V CAPSULES '125'

Pancreatic insufficiency

▸ BY MOUTH

▸ Neonate: 1–2 capsules, contents of capsule to be given in each feed (or mixed with feed and given by spoon).

PANCREX® V POWDER

Pancreatic insufficiency

▸ BY MOUTH

▸ Neonate: 250–500 mg, dose to be taken with each feed.

▸ Child: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water

- **CONTRA-INDICATIONS**

  PANCREASE HL® Should not be used in children aged 15 years or less with cystic fibrosis

  NUTRIZYM 22® GASTRO-RESISTANT CAPSULES Should not be used in children aged 15 years or less with cystic fibrosis
- **CAUTIONS** Can irritate the perioral skin and buccal mucosa if retained in the mouth · excessive doses can cause perianal irritation
- **INTERACTIONS** → Appendix 1: pancreatin
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distension · constipation · nausea · vomiting
  - **Uncommon** Skin reactions
  - **Frequency not known** Fibrosing colonopathy
- **PREGNANCY** Not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** Pancreatin is inactivated by gastric acid therefore manufacturer advises pancreatin preparations are best taken with food (or immediately before or after food). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; manufacturer advises the resulting mixtures should not be kept for more than one hour and any left-over food or liquid containing pancreatin should be discarded. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Manufacturer advises gastro-resistant granules should be mixed with slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. For infants, *Creon® Micro* granules can be mixed with a small amount of milk on a spoon and administered immediately—granules should not be added to the baby's bottle. Manufacturer advises *Pancrex® V* powder may be administered via nasogastric tube or gastrostomy tube—consult local and national official guidelines.
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations may contain pork pancreatin—consult product literature.
- **HANDLING AND STORAGE** Hypersensitivity reactions have occasionally occurred in those handling the powder.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on administration. It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

  Medicines for Children leaflet: Pancreatin for pancreatic insufficiency www.medicinesforchildren.org.uk/medicines/pancreatin-for-pancreatic-insufficiency/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

- **Creon** (Viatris UK Healthcare Ltd)
  Protease 600 unit, Amylase 8000 unit, Lipase 10000 unit Creon 10000 gastro-resistant capsules | 100 capsule P £12.93

  Protease 1100 unit, Amylase 19800 unit, Lipase 22000 unit Nutrizym 22 gastro-resistant capsules | 100 capsule PoM £33.33
- **Pancrease** (Janssen-Cilag Ltd)
  Protease 1250 unit, Amylase 22500 unit, Lipase 25000 unit Pancrease HL gastro-resistant capsules | 100 capsule PoM £40.38

Gastro-resistant granules

CAUTIONARY AND ADVISORY LABELS 25

- **Creon** (Viatris UK Healthcare Ltd)
  Protease 200 unit, Amylase 3600 unit, Lipase 5000 unit Creon Micro Pancreatin 60.12mg gastro-resistant granules | 20 gram P £31.50

Powder

- **Pancrex** (Essential Pharmaceuticals Ltd)
  Protease 1400 unit, Lipase 25000 unit, Amylase 30000 unit Pancrex V oral powder sugar-free | 300 gram P £224.00

Capsule

- **Pancrex** (Essential Pharmaceuticals Ltd)
  Protease 160 unit, Lipase 2950 unit, Amylase 3300 unit Pancrex V 125mg capsules | 300 capsule P £42.07
  Protease 430 unit, Lipase 8000 unit, Amylase 9000 unit Pancrex V capsules | 300 capsule P £53.20

5 Food allergy

Food allergy

08-Jun-2021

Description of condition

Food allergy is an adverse immune response to a food, commonly associated with cutaneous and gastro-intestinal reactions, and less frequently associated with respiratory reactions and anaphylaxis. It is distinct from food intolerance which is non-immunological. Cow's milk, hen's eggs, soy, wheat, peanuts, tree nuts, fish, and shellfish are the most common allergens. Cross-reactivity between similar foods can occur (e.g. allergy to other mammalian milk in patients with cow's milk allergy).

Management of food allergy

EvGr Allergy caused by specific foods should be managed by strict avoidance of the causal food. Sodium cromoglicate p. 182 is licensed as an adjunct to dietary avoidance in children with food allergy. Educating the child or their carer about appropriate nutrition, food preparation, and the risks of accidental exposure is recommended, such as food and drinks to avoid, ensuring adequate nutritional intake, and interpreting food labels. For children in whom elimination diets might affect growth, a consultation with a nutritionist is recommended to identify alternative dietary sources. A

Drug treatment

EvGr There is low quality evidence to support the use of antihistamines to treat acute, **non-life-threatening** symptoms (such as flushing and urticaria) if accidental ingestion of allergenic food has occurred. Chlorphenamine maleate p. 193 is licensed for the symptomatic control of food allergy. In case of food-induced anaphylaxis, intramuscular adrenaline/epinephrine p. 149 is the first-line immediate treatment. Carers and children (of an appropriate

age) who are at risk of anaphylaxis should be trained to use self-injectable adrenaline/epinephrine. Ⓐ For further guidance, see Antihistamines, allergen immunotherapy and allergic emergencies p. 186.

Cow's milk allergy

EvGr Parents of infants with suspected allergy to cow's milk should be informed about the most appropriate hypoallergenic formula or milk substitute. Cow's milk avoidance is recommended for the mothers of breast-fed infants who have cow's milk allergy. Children who are allergic to milk should receive alternative dietary sources of calcium and vitamin D. Ⓐ

6 Gastric acid disorders and ulceration

6.1 Dyspepsia

Dyspepsia

03-Jan-2019

Description of condition

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration, gastro-oesophageal reflux disease, gastritis, and upper gastro-intestinal motility disorders, but most commonly it is of uncertain origin.

Non-drug treatment

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, Smoking cessation p. 330, and raising the head of the bed.

Drug treatment

Some medications may cause dyspepsia—these should be stopped, if possible.

A compound alginate preparation may provide relief from dyspepsia; persistent dyspepsia requires investigation. Treatment with a H_2-receptor antagonist or a proton pump inhibitor should be initiated only on the advice of a hospital specialist.

Helicobacter pylori may be present in children with dyspepsia. *H. pylori* eradication therapy should be considered for persistent dyspepsia if it is ulcer-like. However, most children with functional (investigated, non-ulcer) dyspepsia do not benefit symptomatically from *H. pylori* eradication.

ANTACIDS › ALGINATE

Alginic acid

09-Nov-2021

● **INDICATIONS AND DOSE**

GAVISCON INFANT ® POWDER SACHETS

Management of gastro-oesophageal reflux disease

▸ BY MOUTH

- Neonate (body-weight up to 4.5 kg): 1 sachet as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 sachets per day.
- Neonate (body-weight 4.5 kg and above): 2 sachets as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 sachets per day.
- Child 1–23 months (body-weight up to 4.5 kg): 1 sachet as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 sachets per day
- Child 1–23 months (body-weight 4.5 kg and above): 2 sachets as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 sachets per day

● **CONTRA-INDICATIONS** Intestinal obstruction · preterm neonates · where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)

GAVISCON INFANT ® POWDER SACHETS Concurrent use of preparations containing thickening agents

● **RENAL IMPAIRMENT** EvGr Avoid (risk of hypernatraemia). Ⓜ

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder

ELECTROLYTES: May contain Sodium

- **Gaviscon Infant** (Forum Health Products Ltd)

Combinations available: ***Co-simalcite***, p. 57 · ***Simeticone with aluminium hydroxide and magnesium hydroxide***, p. 57

6.2 Gastric and duodenal ulceration

Peptic ulceration

Overview

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, Smoking cessation p. 330 and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by *Helicobacter pylori*.

Helicobacter pylori infection

Eradication of *Helicobacter pylori* reduces the recurrence of gastric and duodenal ulcers and the risk of rebleeding. The presence of *H. pylori* should be confirmed before starting eradication treatment. If possible, the antibacterial sensitivity of the organism should be established at the time of endoscopy and biopsy. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of *H. pylori*; reinfection is rare. Antibiotic-associated colitis is an uncommon risk.

Treatment to eradicate *H. pylori* infection in children should be initiated under specialist supervision. One week triple-therapy regimens that comprise omeprazole p. 63, amoxicillin p. 388, and either clarithromycin p. 375 or metronidazole p. 381 are recommended. Resistance to clarithromycin or to metronidazole is much more common than to amoxicillin and can develop during treatment. A regimen containing amoxicillin and clarithromycin is therefore recommended for initial therapy and one containing amoxicillin and metronidazole is recommended for eradication failure or for a child who has been treated with a macrolide for other infections. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H_2-receptor antagonist); however, if the ulcer is large, or complicated by haemorrhage or perforation then antisecretory treatment is continued for a further 3 weeks. Lansoprazole p. 62 may be considered if omeprazole is unsuitable. Treatment failure usually indicates antibacterial resistance or poor compliance.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial produce low rates of *H. pylori* eradication and are **not** recommended.

See under *NSAID-associated ulcers* for the role of *H. pylori* eradication therapy in children starting or taking NSAIDs.

Test for *Helicobacter pylori*

^{13}C-Urea breath test kits are available for confirming the presence of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of ^{13}C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ^{13}C-Urea breath test kit for children is available (*Helicobacter Test INFAI for children of the age* 3–11®). However the appropriateness of testing for *H. pylori* infection in children has not been established. Breath, saliva, faecal, and urine tests for *H. pylori* are frequently unreliable in children; the most accurate method of diagnosis is endoscopy with biopsy.

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. Whenever possible, NSAIDs should be **withdrawn** if an ulcer occurs.

Children at high risk of developing gastro-intestinal complications with a NSAID include those with a history of peptic ulcer disease or serious upper gastro-intestinal complication, those taking other medicines that increase the risk of upper gastro-intestinal side-effects, or those with serious co-morbidity. In children at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; high dose ranitidine p. 60 is an alternative.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In children already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in children about to start long-term NSAID treatment who are *H. pylori* positive and have dyspepsia or a history of gastric or duodenal ulcer, eradication of *H. pylori* may reduce the overall risk of ulceration.

If the NSAID can be *discontinued* in a child who has developed an ulcer, a proton pump inhibitor usually produces the most rapid healing; alternatively the ulcer can be treated with an H_2-receptor antagonist.

If *NSAID treatment needs to continue*, the ulcer is treated with a proton pump inhibitor.

GASTROPROTECTIVE COMPLEXES AND CHELATORS

Sucralfate

19-Nov-2021

- **DRUG ACTION** Sucralfate is a complex of aluminium hydroxide and sulfated sucrose which forms a barrier to protect the mucosa from acid, pepsin and bile attack in gastric and duodenal ulcers.

- **INDICATIONS AND DOSE**

Benign gastric ulceration | Benign duodenal ulceration

- BY MOUTH
- Child 1 month–1 year: 250 mg 4–6 times a day
- Child 2–11 years: 500 mg 4–6 times a day
- Child 12–14 years: 1 g 4–6 times a day
- Child 15–17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

Prophylaxis of stress ulceration in child under intensive care

- BY MOUTH
- Child 1 month–1 year: 250 mg 4–6 times a day
- Child 2–11 years: 500 mg 4–6 times a day
- Child 12–14 years: 1 g 4–6 times a day
- Child 15–17 years: 1 g 6 times a day; maximum 8 g per day

- **UNLICENSED USE** Not licensed for use in children under 15 years. Tablets not licensed for prophylaxis of stress ulceration.
- **CAUTIONS** Patients under intensive care (**Important:** reports of bezoar formation)

CAUTIONS, FURTHER INFORMATION

- Bezoar formation Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.

- **INTERACTIONS** → Appendix 1: sucralfate
- **SIDE-EFFECTS**
- **Common or very common** Constipation
- **Uncommon** Dry mouth · nausea
- **Rare or very rare** Bezoar · rash
- **Frequency not known** Back pain · bone disorders · diarrhoea · dizziness · drowsiness · encephalopathy · flatulence · headache · vertigo
- **PREGNANCY** No evidence of harm; absorption from gastro-intestinal tract negligible.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **RENAL IMPAIRMENT** EvGr Caution (aluminium is absorbed and may accumulate). Ⓜ
- **DIRECTIONS FOR ADMINISTRATION** Expert sources advise administration of sucralfate and enteral feeds should be separated by 1 hour. EvGr For administration by *mouth*, sucralfate should be given 1 hour before meals. Ⓜ *Oral suspension* blocks fine-bore feeding tubes. Expert sources advise crushed *tablets* may be dispersed in water.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed and caramel.

Ranitidine

11-Nov-2021

● **INDICATIONS AND DOSE**

Benign gastric ulceration | Duodenal ulceration

▸ BY MOUTH

▸ Neonate: 2 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day), oral absorption is unreliable.

▸ Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
▸ Child 6 months–2 years: 2–4 mg/kg twice daily
▸ Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
▸ Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night

Prophylaxis of stress ulceration

▸ INITIALLY BY SLOW INTRAVENOUS INJECTION

▸ Neonate: 0.5–1 mg/kg every 6–8 hours.

▸ Child 1 month–11 years: 1 mg/kg every 6–8 hours (max. per dose 50 mg), may be given as an intermittent infusion at a rate of 25 mg/hour
▸ Child 12–17 years: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

Reflux oesophagitis and other conditions where gastric acid reduction is beneficial

▸ BY MOUTH

▸ Neonate: 2 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day), oral absorption is unreliable.

▸ Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
▸ Child 6 months–2 years: 2–4 mg/kg twice daily
▸ Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease
▸ Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

▸ BY SLOW INTRAVENOUS INJECTION

▸ Neonate: 0.5–1 mg/kg every 6–8 hours.

▸ Child: 1 mg/kg every 6–8 hours (max. per dose 50 mg), may be given as an intermittent infusion at a rate of 25 mg/hour

● **UNLICENSED USE** *Oral* preparations not licensed for use in children under 3 years. *Injection* not licensed for use in children under 6 months.

● **INTERACTIONS** → Appendix 1: H_2 receptor antagonists

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

▸ **Rare or very rare** Bone marrow depression · bradycardia · breast conditions · dyskinesia · nephritis acute interstitial · pancreatitis acute · vision blurred
▸ **Frequency not known** Dyspnoea

SPECIFIC SIDE-EFFECTS

▸ **Rare or very rare**
▸ With parenteral use Anaphylactic shock · cardiac arrest

● **PREGNANCY** Manufacturer advises avoid unless essential, but not known to be harmful.

● **BREAST FEEDING** Significant amount present in milk, but not known to be harmful.

● **RENAL IMPAIRMENT**
Dose adjustments Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m^2.

● **DIRECTIONS FOR ADMINISTRATION** For *slow intravenous injection* expert sources advise dilute to a concentration of 2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 3 minutes.

● **PATIENT AND CARER ADVICE** In fat malabsorption syndrome, give oral doses 1–2 hours before food to enhance effects of pancreatic enzyme replacement.
Medicines for Children leaflet: Ranitidine for acid reflux
www.medicinesforchildren.org.uk/medicines/ranitidine-for-acid-reflux/

● **EXCEPTIONS TO LEGAL CATEGORY** Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, infusion

Tablet

▸ Ranitidine (Non-proprietary)
Ranitidine (as Ranitidine hydrochloride) 75 mg Ranitidine 75mg tablets | 12 tablet GSL £0.30–£0.36

Solution for injection

▸ Ranitidine (Non-proprietary)
Ranitidine (as Ranitidine hydrochloride) 25 mg per 1 ml Ranitidine 50mg/2ml solution for injection ampoules | 5 ampoule PoM £2.69 DT = £2.69

Oral solution

EXCIPIENTS: May contain Alcohol

PROTON PUMP INHIBITORS

Proton pump inhibitors

Overview

Omeprazole p. 63 is an effective short-term treatment for *gastric* and *duodenal ulcers*; it is also used in combination with antibacterials for the eradication of *Hellicobacter pylori*. An initial short course of omeprazole is the treatment of choice in *gastro-oesophageal reflux disease* with severe symptoms; children with endoscopically confirmed *erosive, ulcerative, or stricturing oesophagitis* usually need to be maintained on omeprazole.

Omeprazole is also used for the prevention and treatment of NSAID-associated ulcers. In children who need to continue NSAID treatment after an ulcer has healed, the dose of omeprazole should not normally be reduced because asymptomatic ulcer deterioration may occur.

Omeprazole is effective in the treatment of the *Zollinger-Ellison syndrome* (including cases resistant to other treatment). It is also used to reduce the degradation of pancreatic enzyme supplements in children with cystic fibrosis.

Lansoprazole p. 62 is not licensed for use in children, but may be considered when the available formulations of omeprazole are unsuitable.

Esomeprazole p. 61 can be used for the management of gastro-oesophageal reflux disease when the available formulations of omeprazole and lansoprazole are unsuitable.

Proton pump inhibitors

- **DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the 'proton pump') of the gastric parietal cell.

IMPORTANT SAFETY INFORMATION

MHRA ADVICE: PROTON PUMP INHIBITORS (PPIS): VERY LOW RISK OF SUBACUTE CUTANEOUS LUPUS ERYTHEMATOSUS (SEPTEMBER 2015)

Very infrequent cases of subacute cutaneous lupus erythematosus (SCLE) have been reported in patients taking PPIs. Drug-induced SCLE can occur weeks, months or even years after exposure to the drug.

If a patient treated with a PPI develops lesions—especially in sun-exposed areas of the skin—and it is accompanied by arthralgia:

- advise them to avoid exposing the skin to sunlight;
- consider SCLE as a possible diagnosis;
- consider discontinuing PPI treatment unless it is imperative for a serious acid-related condition; a patient who develops SCLE with a particular PPI may be at risk of the same reaction with another;
- in most cases, symptoms resolve on PPI withdrawal; topical or systemic steroids might be necessary for treatment of SCLE only if there are no signs of remission after a few weeks or months.

- **CAUTIONS** May increase the risk of gastro-intestinal infections (including *Clostridioides difficile* infection) · may reduce absorption of vitamin B_{12} with long-term treatment · patients at risk of osteoporosis

CAUTIONS, FURTHER INFORMATION

- **Risk of osteoporosis** Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.

- **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · constipation · diarrhoea · dizziness · dry mouth · gastrointestinal disorders · headache · insomnia · nausea · skin reactions · vomiting
- **Uncommon** Arthralgia · bone fractures · confusion · depression · drowsiness · leucopenia · malaise · myalgia · paraesthesia · peripheral oedema · thrombocytopenia · vertigo · vision disorders
- **Rare or very rare** Agranulocytosis · alopecia · gynaecomastia · hallucination · hepatic disorders · hyperhidrosis · hyponatraemia · nephritis tubulointerstitial · pancytopenia · photosensitivity reaction · severe cutaneous adverse reactions (SCARs) · stomatitis · taste altered
- **Frequency not known** Hypomagnesaemia (more common after 1 year of treatment, but sometimes after 3 months of treatment) · subacute cutaneous lupus erythematosus

- **MONITORING REQUIREMENTS** Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.

- **PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

above

Esomeprazole

20-May-2021

- **INDICATIONS AND DOSE**

Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)

- BY MOUTH
- Child 1–11 years (body-weight 10–19 kg): 10 mg once daily for 8 weeks
- Child 1–11 years (body-weight 20 kg and above): 10–20 mg once daily for 8 weeks
- Child 12–17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child 1–11 years (body-weight up to 20 kg): 10 mg once daily, injection to be given over at least 3 minutes
- Child 1–11 years (body-weight 20 kg and above): 10–20 mg once daily, injection to be given over at least 3 minutes
- Child 12–17 years: 40 mg daily, injection to be given over at least 3 minutes

Gastro-oesophageal reflux disease (in the absence of oesophagitis)

- BY MOUTH
- Child 1–11 years (body-weight 10 kg and above): 10 mg once daily for up to 8 weeks
- Child 12–17 years: 20 mg once daily for up to 4 weeks
- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child 1–11 years: 10 mg once daily, injection to be given over at least 3 minutes
- Child 12–17 years: 20 mg once daily, injection to be given over at least 3 minutes

- **INTERACTIONS** → Appendix 1: proton pump inhibitors

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare or very rare** Aggression · agitation · bronchospasm · increased risk of infection · muscle weakness · renal failure

SPECIFIC SIDE-EFFECTS

- **Rare or very rare**
- With parenteral use Encephalopathy

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Specialist sources indicate use with caution—limited human data available. Likely to be present in milk, but amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

Dose adjustments Manufacturer advises in children 1–11 years, max. 10 mg daily in severe impairment.

Manufacturer advises in children 12–17 years, max. 20 mg daily in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal insufficiency.

- **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use EvGr For *intravenous infusion*, dilute reconstituted solution to a concentration not exceeding 800 micrograms/mL with Sodium Chloride 0.9%; give over 10–30 minutes. M
- With oral use EvGr Do not chew or crush capsules; swallow whole *or* mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole *or* disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. M For administration through a gastric tube, consult product literature.

- **PATIENT AND CARER ADVICE** Counselling on administration of gastro-resistant capsules, tablets, and granules advised.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Gastro-resistant capsule

- **Esomeprazole (Non-proprietary)**

- BY INTRAVENOUS INFUSION
- Child 1 month–11 years: Initially 500 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg)
- Child 12–17 years: 40 mg once daily

● **UNLICENSED USE** Omeprazole *capsules*, *tablets* and *oral suspension* may be used in neonates, but they are not licensed for this age group. Omeprazole *capsules*, *tablets* and *oral suspension* may be used in children as detailed below, although these situations are considered unlicensed:

- *Helicobacter pylori* eradication in combination with antibiotics in children aged under 4 years;

- treatment of duodenal ulcers including those complicating NSAID therapy;
- treatment of benign gastric ulcers including those complicating NSAID therapy;
- Zollinger-Ellison syndrome;
- gastro-oesophageal reflux disease and acid-related dyspepsia in children aged under 1 year and under 10 kg for *capsules* and *tablets*, and in children aged under 1 month for *oral suspension*;
- fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis.

Omeprazole for *intravenous infusion* may be used in children aged 12–17 years, but it is not licensed for this age group.

- **INTERACTIONS** → Appendix 1: proton pump inhibitors
- **SIDE-EFFECTS**

▸ **Rare or very rare** Aggression · agitation · bronchospasm · encephalopathy · gastrointestinal candidiasis · muscle weakness

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Specialist sources indicate amount in milk is small and not known to be harmful; EvGr therapeutic doses unlikely to affect infant. M
- **HEPATIC IMPAIRMENT**

Dose adjustments No more than 700 micrograms/kg (max. 20 mg) once daily.

- **DIRECTIONS FOR ADMINISTRATION** For administration by *mouth* using tablets or capsules:
  - Tablets (*Losec MUPS*®, *Mezzopram*®) or capules (*Losec*®) containing enteric-coated pellets can be dispersed in non-carbonated water or a slightly acidic liquid e.g. fruit juice or apple sauce; do **not** use milk or carbonated water. The dispersion should be stirred just before drinking and taken immediately, rinsed down with half a glass of water. The enteric-coated pellets must not be chewed.
  - Enteric-coated tablets (*Dexcel*®) or capsules containing an enteric-coated tablet (*Mepradec*®) must be swallowed whole and not chewed or crushed.

For instructions on reconstitution of oral suspension, consult product literature.

For administration through an *enteral feeding tube*, expert sources advise use *Losec MUPS*® or suspend the contents of a capsule containing omeprazole in 10 mL Sodium Bicarbonate 8.4% (1 mmol Na^+/mL). Allow to stand for 10 minutes before administration.

▸ With intravenous use EvGr For *intermittent intravenous infusion*, dilute reconstituted solution to a concentration of 400 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes. M

- **PATIENT AND CARER ADVICE**

6.3 Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease

24-Jan-2022

Description of condition

Gastro-oesophageal reflux is the passage of gastric contents into the oesophagus and occurs as a result of transient lower oesophageal sphincter relaxation. It is considered physiological in infants when symptoms are absent or not troublesome. Regurgitation is the voluntary or involuntary movement of part or all of the stomach contents up the oesophagus at least as far as the mouth and often emerging from the mouth. It is common in infants under the age of 1 year and considered normal, and usually resolves without treatment before 1 year of age. Gastro-oesophageal reflux disease (GORD) occurs when reflux results in complications, or symptoms are severe enough to require medical treatment.

In infants up to 1 year of age symptoms suggestive of GORD include excessive crying, crying when feeding, unusual neck posture, hoarseness, chronic cough, faltering growth and feeding difficulties such as gagging, choking or refusal. In older children symptoms include heartburn, retrosternal and epigastric pain.

Risk factors for developing GORD include premature birth, hiatus hernia and neurodisability. Complications that might occur include reflux oesophagitis, aspiration pneumonia, dental erosions and recurrent otitis media.

In children with vomiting and regurgitation problems, look for 'red flag symptoms' such as frequent and forceful vomiting, bile-stained vomit, or blood in vomit or stools, that may suggest disorders other than GORD.

Aims of treatment

The aim of treatment is to manage symptoms of GORD in children and raise awareness of symptoms that need investigating.

Non-drug treatment

EvGr Parents and carers of well infants should be reassured that most symptoms of uncomplicated gastro-oesophageal reflux are common and resolve without treatment before 1 year of age.

In breast-fed infants with frequent regurgitation and marked distress, ensure that a person with appropriate expertise and training carries out a breastfeeding assessment.

In formula-fed infants with frequent regurgitation and marked distress use a stepped care approach with review of feeding history, reduction of feed volumes if excessive for the infant's weight, and then a 1–2 week trial of smaller and more frequent feeds. If symptoms are still not improving give a trial of thickened formula for another 1–2 weeks.

Children and adolescents who are obese should be advised that weight reduction may help with their symptoms.

Surgery may be considered under specialist advice for children with severe, intractable GORD where medical treatment has been unsuccessful, or feeding regimens to manage symptoms have proved impractical. A

Drug treatment

Initial management

EvGr If non-pharmacological methods fail for breast-fed infants, consider alginic acid p. 56 for 1–2 weeks. If successful, this should be continued but consider withholding it at intervals to see if the infant has recovered.

If non-pharmacological methods fail for formula-fed infants, the thickened formula should be stopped and a trial of alginic acid for 1–2 weeks should be used. If successful, it should be continued, but consider withholding it at intervals to see if the infant has recovered.

Acid-suppressing drugs, such as Proton pump inhibitors p. 60 or histamine$_2$-receptor antagonists (H_2-receptor antagonists) should not be used to treat regurgitation in children occurring as an isolated symptom. A

Follow up management

EvGr For children who are unable to communicate about their symptoms (e.g. infants, young children and those with communication difficulties), a 4-week trial of a proton pump inhibitor (PPI) or H_2-receptor antagonist should be considered in those who have regurgitation with one or more of the following symptoms: unexplained feeding difficulties, distressed behaviour or faltering growth.

For children and young people with persistent heartburn, retrosternal or epigastric pain, a 4-week trial of a PPI or H_2-receptor antagonist should be considered.

When choosing between a PPI or H_2-receptor antagonist availability of age-appropriate preparations, patient/carer preference should be taken into account.

Response to treatment should be reviewed after 4 weeks and referral for endoscopy considered if the symptoms did not resolve, or recur after stopping treatment.

Treatment of gastro-oesophageal reflux or GORD with metoclopramide hydrochloride p. 292 (unlicensed), domperidone p. 291 (unlicensed), or erythromycin p. 378 (unlicensed) should only be offered when the benefits outweigh the risk of side-effects, other interventions have been tried, and there is specialist paediatric agreement for its use.

Infants, children and young people with endoscopy-proven reflux oesophagitis should be offered treatment with a PPI or H_2-receptor antagonist, and repeat endoscopic examination performed as necessary to guide subsequent treatment. A

Enteral tube feeding

EvGr Enteral tube feeding should only be considered as an option to promote weight gain in infants and children with regurgitation and faltering growth if other pathologies have been ruled out, and/or the recommended feeding and medical management is unsuccessful.

A specific and individualised nutrition plan must be in place for these children with a strategy to reduce it as soon as possible. Oral stimulation is encouraged by continuing oral feeding as tolerated, ensuring that the intended target weight is achieved and sustained. Enteral tube feeding should be reduced and stopped as soon as possible.

Jejunal feeding can be considered in patients who need enteral tube feeding but cannot tolerate intragastric feeds because of regurgitation or if reflux-related pulmonary aspiration is a concern. A

For advice on specialised formula feeds, see Enteral nutrition p. 709.

GORD in pregnancy

EvGr Heartburn and acid reflux are symptoms of Dyspepsia p. 56 in pregnancy commonly caused by GORD. Dietary and lifestyle advice should be given as first-line management. If this approach fails to control symptoms, an antacid or an alginate can be used. If this is ineffective or symptoms are severe omeprazole p. 63 or ranitidine p. 60 (unlicensed) may help to control symptoms. A

6.4 Helicobacter pylori infection

DIAGNOSTIC AGENTS

Urea (13C)

● **INDICATIONS AND DOSE**

Diagnosis of gastro-duodenal *Helicobacter pylori* infection

- BY MOUTH
- Child: (consult product literature)

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder

- **Helicobacter Test INFAI** (INFAI UK Ltd)
  Urea [13-C] 45 mg Helicobacter Test INFAI for children breath test kit sugar-free | 1 kit PoM £15.00 DT = £15.00
  Urea [13-C] 75 mg Helicobacter Test INFAI breath test kit sugar-free | 1 kit PoM £17.00 DT = £17.00 sugar-free | 50 kit PoM £725.00

Tablet

- **Diabact UBT** (HFA Healthcare Products Ltd)
  Urea [13-C] 50 mg diabact UBT 50mg tablets | 1 tablet PoM £21.25 DT = £21.25 | 10 tablet PoM £78.75 (Hospital only)

7 Gastro-intestinal smooth muscle spasm

Antispasmodics

02-May-2020

Antimuscarinics

Antimuscarinics (formerly termed 'anticholinergics') reduce intestinal motility and are used for gastro-intestinal smooth muscle spasm. They include the tertiary amine dicycloverine hydrochloride below, and the quaternary ammonium compounds propantheline bromide p. 68 and hyoscine butylbromide p. 67. The quaternary ammonium compounds are less lipid soluble than tertiary amines and are less likely to cross the blood-brain barrier; therefore have a lower risk for central nervous system side-effects. They are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but is poorly absorbed.

Other antispasmodics

Alverine citrate p. 68, mebeverine hydrochloride p. 68, and peppermint oil p. 37 are direct-acting intestinal smooth muscle relaxants and may relieve abdominal pain or spasm in Irritable bowel syndrome p. 37.

Motility stimulants

Domperidone is a dopamine receptor antagonist which accelerates gastric emptying, improves gastroduodenal motility, and enhances the strength of lower oesophageal sphincter pressure. The MHRA and CHM have released important safety information and restrictions regarding the use of domperidone, and a reminder of contra-indications. For further information, see *Important safety information* for domperidone p. 291.

A low dose of erythromycin p. 378 stimulates gastro-intestinal motility. Expert sources advise that erythromycin may help some neonates with gut motility problems; its value in speeding up full enteral feeding and reduction in total parental nutrition (TPN)-associated cholestasis must be weighed against possible occurrence of pyloric stenosis after high-dose use.

ANTIMUSCARINICS

F 555

Dicycloverine hydrochloride

(Dicyclomine hydrochloride)

23-Apr-2020

● **INDICATIONS AND DOSE**

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- BY MOUTH
- Child 6–23 months: 5–10 mg 3–4 times a day, dose to be taken 15 minutes before feeds
- Child 2–11 years: 10 mg 3 times a day
- Child 12–17 years: 10–20 mg 3 times a day

● **CONTRA-INDICATIONS** Child under 6 months

● **INTERACTIONS** → Appendix 1: dicycloverine

● **SIDE-EFFECTS** Appetite decreased · fatigue · thirst

● **PREGNANCY** Not known to be harmful; manufacturer advises use only if essential.

● **BREAST FEEDING** Avoid—present in milk; apnoea reported in infant.

● **EXCEPTIONS TO LEGAL CATEGORY** Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

▸ **Dicycloverine hydrochloride (Non-proprietary)**
Dicycloverine hydrochloride 2 mg per 1 ml Dicycloverine 10mg/5ml oral solution | 120 ml PoM £174.13 DT = £174.13

Tablet

▸ **Dicycloverine hydrochloride (Non-proprietary)**
Dicycloverine hydrochloride 10 mg Dicycloverine 10mg tablets | 100 tablet PoM £212.54 DT = £212.50
Dicycloverine hydrochloride 20 mg Dicycloverine 20mg tablets | 84 tablet PoM £226.81 DT = £226.78

Dicycloverine hydrochloride with aluminium hydroxide, magnesium oxide and simeticone

28-Apr-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, dicycloverine hydrochloride p. 66, simeticone p. 58.

● **INDICATIONS AND DOSE**

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

► BY MOUTH
▸ Child 12-17 years: 10–20 mL every 4 hours as required

● **INTERACTIONS** → Appendix 1: aluminium hydroxide · antacids · dicycloverine · magnesium

● **SIDE-EFFECTS** Anticholinergic syndrome

● **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

▸ **Kolanticon** (Esteve Pharmaceuticals Ltd)
Dicycloverine hydrochloride 500 microgram per 1 ml, Simeticone 4 mg per 1 ml, Magnesium oxide light 20 mg per 1 ml, Aluminium hydroxide dried 40 mg per 1 ml Kolanticon gel sugar-free | 200 ml P £4.00 sugar-free | 500 ml P £6.00

555

Hyoscine butylbromide

25-Nov-2020

● **INDICATIONS AND DOSE**

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

► BY MOUTH
▸ Child 6-11 years: 10 mg 3 times a day
▸ Child 12-17 years: 20 mg 4 times a day

Acute spasm | Spasm in diagnostic procedures

► INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
▸ Child 2-5 years: 5 mg, then (by intramuscular injection or by slow intravenous injection) 5 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 15 mg per day
▸ Child 6-11 years: 5–10 mg, then (by intramuscular injection or by intravenous injection) 5–10 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 30 mg per day
▸ Child 12-17 years: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 80 mg per day

Excessive respiratory secretions in palliative care

► BY MOUTH
▸ Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
▸ Child 2-4 years: 5 mg 3–4 times a day
▸ Child 5-11 years: 10 mg 3–4 times a day
▸ Child 12-17 years: 10–20 mg 3–4 times a day
► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
▸ Child 1 month-4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
▸ Child 5-11 years: 5–10 mg 3–4 times a day
▸ Child 12-17 years: 10–20 mg 3–4 times a day

Bowel colic in palliative care

► BY MOUTH
▸ Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
▸ Child 2-4 years: 5 mg 3–4 times a day
▸ Child 5-11 years: 10 mg 3–4 times a day
▸ Child 12-17 years: 10–20 mg 3–4 times a day
► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
▸ Child 1 month-4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
▸ Child 5-11 years: 5–10 mg 3–4 times a day
▸ Child 12-17 years: 10–20 mg 3–4 times a day

PHARMACOKINETICS

▸ Administration by mouth is associated with poor absorption.

● **UNLICENSED USE** *Tablets* not licensed for use in children under 6 years. *Injection* not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HYOSCINE BUTYLBROMIDE (*BUSCOPAN*®) INJECTION: RISK OF SERIOUS ADVERSE EFFECTS IN PATIENTS WITH UNDERLYING CARDIAC DISEASE (FEBRUARY 2017)

The MHRA advises that hyoscine butylbromide injection can cause serious adverse effects including tachycardia, hypotension, and anaphylaxis; several reports have noted that anaphylaxis is more likely to be fatal in patients with underlying coronary heart disease. Hyoscine butylbromide injection is contra-indicated in patients with tachycardia and should be used with caution in patients with cardiac disease; the MHRA recommends that these patients are monitored and that resuscitation equipment and trained personnel are readily available.

● **CONTRA-INDICATIONS**

▸ With intramuscular use or intravenous use Tachycardia

● **INTERACTIONS** → Appendix 1: hyoscine

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Dyspnoea

SPECIFIC SIDE-EFFECTS

▸ With parenteral use Feeling hot · hypotension · mydriasis · sweat changes

● **PREGNANCY** Manufacturer advises avoid.

● **BREAST FEEDING** Amount too small to be harmful.

● **DIRECTIONS FOR ADMINISTRATION** For administration by *mouth*, expert sources advise injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.

For *intravenous injection*, expert sources advise may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.

- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of hyoscine butylbromide in palliative care, see www.medicinescomplete.com/#/content/palliative/hyoscine-butylbromide.

- **EXCEPTIONS TO LEGAL CATEGORY** Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

- **Hyoscine butylbromide (Non-proprietary)**

8 Liver disorders and related conditions

8.1 Biliary disorders

Cholestasis

14-Sep-2020

Description of condition

Cholestasis is an impairment of bile formation and/or bile flow, which may clinically present with fatigue, pruritus, dark urine, pale stools and, in its most overt form, jaundice and signs of fat soluble vitamin deficiencies.

Treatment

EvGr Ursodeoxycholic acid p. 71 [unlicensed] and colestyramine p. 142 [unlicensed under 6 years] are used to relieve cholestatic pruritus in children, even if evidence to support their use is limited.

Colestyramine is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves pruritus by forming an insoluble complex in the intestine with bile acids and other compounds—the reduction of serum bile acid levels reduces excess deposition in the dermal tissue with a resultant decrease in pruritus.

Alternative drugs for **intractable** cholestatic pruritus should be used with caution and **under specialist supervision** as these children usually have severe liver disease—careful monitoring is required. Drugs that may be considered include rifampicin p. 419 [unlicensed indication], opioid antagonists [unlicensed indication], and phenobarbital p. 243 [unlicensed indication]. ◈E The MHRA/CHM have released important safety information on the use of antiepileptic drugs and the risk of suicidal thoughts and behaviour. For further information, see Epilepsy p. 211.

Inborn errors of primary bile acid synthesis

27-Apr-2018

Description of condition

Inborn errors of primary bile acid synthesis are a group of diseases in which the liver does not produce enough primary bile acids due to enzyme deficiencies. These acids are the main components of the bile, and include cholic acid and chenodeoxycholic acid.

Treatment

Cholic acid p. 70 is licensed for the treatment of inborn errors of primary bile acid synthesis due to an inborn deficiency of two specific liver enzymes. It acts by replacing some of the missing bile acids, therefore relieving the symptoms of the disease.

Chenodeoxycholic acid p. 70 is licensed for the treatment of inborn errors of primary bile acid synthesis due to a deficiency of one specific enzyme in the bile acid synthesis pathway when presenting as cerebrotendinous xanthomatosis.

Ursodeoxycholic acid p. 71 [unlicensed indication] has been used to treat inborn errors in primary bile acid synthesis, but there is an absence of evidence to recommend its use.

Primary biliary cholangitis

30-May-2017

Description of condition

Primary biliary cholangitis (or primary biliary cirrhosis) is a chronic cholestatic disease which develops due to progressive destruction of small and intermediate bile ducts within the liver, subsequently evolving to fibrosis and cirrhosis.

Treatment

EvGr Ursodeoxycholic acid p. 71 is recommended for the management of primary biliary cholangitis, including those with asymptomatic disease. It slows disease progression, but the effect on overall survival is uncertain. ◈A

Smith-Lemli-Opitz syndrome

30-May-2017

Description of condition

Smith-Lemli-Opitz syndrome is an inborn error of cholesterol synthesis. It is characterised by multiple congenital anomalies, intellectual deficit, growth delay, microcephaly, and behavioural problems. The disease is present at birth, but may be detected in later childhood or adulthood in mild forms. Hypoglycaemia due to adrenal insufficiency can present as an acute manifestation.

Aims of treatment

There is currently no cure for Smith-Lemli-Opitz syndrome. Management is aimed at symptom relief and alleviation of functional disabilities.

Treatment

EvGr Children with Smith-Lemli-Opitz syndrome are treated with dietary cholesterol supplementation, including high cholesterol foods (such as egg yolks) or a suspension of pharmaceutical grade cholesterol p. 71 (available from Special-order manufacturers p. 1256 or specialist importing companies) to help improve growth failure and photosensitivity. ◈E However, it is not clear who will benefit most from cholesterol treatment or how long it should continue.

EvGr In some cases bile acid supplements, such as chenodeoxycholic acid below [unlicensed] and ursodeoxycholic acid p. 71 [unlicensed indication] have been also used for this condition, but their use is not generally recommended. Ⓔ

BILE ACIDS

Chenodeoxycholic acid

05-Apr-2018

INDICATIONS AND DOSE

Cerebrotendinous xanthomatosis (specialist use only)

▶ BY MOUTH

- Child: Initially 5 mg/kg daily in 3 divided doses, adjusted according to response; maximum 15 mg/kg per day; maximum 1000 mg per day

Defective synthesis of bile acid (specialist use only)

▶ BY MOUTH

- Neonate: Initially 5 mg/kg 3 times a day, reduced to 2.5 mg/kg 3 times a day.
- Child: Initially 5 mg/kg 3 times a day, reduced to 2.5 mg/kg 3 times a day

Smith-Lemli-Opitz syndrome (specialist use only)

▶ BY MOUTH

- Neonate: 7 mg/kg once daily, alternatively 7 mg/kg daily in divided doses.
- Child: 7 mg/kg once daily, alternatively 7 mg/kg daily in divided doses

- **UNLICENSED USE** Not licensed for defective synthesis of bile acid. Not licensed for Smith-Lemli-Opitz syndrome.
- **CONTRA-INDICATIONS** Non-functioning gall bladder · radio-opaque stones
- **INTERACTIONS** → Appendix 1: chenodeoxycholic acid
- **SIDE-EFFECTS** Constipation
- **PREGNANCY** Manufacturer advises avoid—fetotoxicity reported in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises monitor—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises to monitor serum cholestanol levels and/or urine bile alcohols every 3 months during the initiation of therapy and dose adjustment, and then at least annually; liver function should also be monitored during initiation of therapy and then at least annually; additional or more frequent investigations may need to be undertaken to monitor therapy during periods of fast growth or concomitant disease.
- **DIRECTIONS FOR ADMINISTRATION** For administration *by mouth* in patients who are unable to swallow capsules and/or need to take a dose below 250 mg, manufacturer advises to add capsule contents to sodium bicarbonate solution 8.4%—for further information, consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

- Chenodeoxycholic acid (non-proprietary) ▼
  Chenodeoxycholic acid 250 mg Chenodeoxycholic acid 250mg capsules | 100 capsule PoM £14,000.00 DT = £14,000.00

Cholic acid

04-Sep-2020

- **DRUG ACTION** Cholic acid is the predominant primary bile acid in humans, which can be used to provide a source of bile acid in patients with inborn deficiencies in bile acid synthesis.

INDICATIONS AND DOSE

Inborn errors of primary bile acid synthesis (initiated by a specialist)

▶ BY MOUTH

- Child (body-weight up to 10 kg): 50 mg daily, then increased in steps of 50 mg daily in divided doses; usual dose 5–15 mg/kg daily in divided doses, dose to be given with food at the same time each day
- Child (body-weight 10 kg and above): Usual dose 5–15 mg/kg daily; increased in steps of 50 mg daily in divided doses if required, dose to be given with food at the same time each day; Usual maximum 500 mg/24 hours

- **INTERACTIONS** → Appendix 1: cholic acid
- **SIDE-EFFECTS** Cholelithiasis (long term use) · diarrhoea · pruritus

  SIDE-EFFECTS, FURTHER INFORMATION Patients presenting with pruritus and/or persistent diarrhoea should be investigated for potential overdose by a serum and/or urine bile acid assay.
- **PREGNANCY** Limited data available—not known to be harmful, manufacturer advises continue treatment.
  Monitoring Manufacturer advises monitor patient parameters more frequently in pregnancy.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution and stop treatment if there are signs of severe hepatic failure—limited information available (no experience with impairment from causes not related to inborn errors of primary bile acid synthesis).
  Dose adjustments Manufacturer advises adjust dose as the degree of impairment improves during treatment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor serum and/or urine bile-acid concentrations every 3 months for the first year, then every 6 months for three years, then annually; monitor liver function tests at the same or greater frequency.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules may be opened and the content added to infant formula, juice, fruit compote, or yoghurt for administration.
- **PATIENT AND CARER ADVICE** Counselling advised on administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ursodeoxycholic acid

02-Sep-2020

● **INDICATIONS AND DOSE**

Cholestasis

► BY MOUTH

- Neonate: 5 mg/kg 3 times a day (max. per dose 10 mg/kg 3 times a day), adjusted according to response.
- Child 1–23 months: 5 mg/kg 3 times a day (max. per dose 10 mg/kg 3 times a day), adjusted according to response

Improvement of hepatic metabolism of essential fatty acids and bile flow, in children with cystic fibrosis

► BY MOUTH

- Child: 10–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses

Cholestasis associated with total parenteral nutrition

► BY MOUTH

- Neonate: 10 mg/kg 3 times a day.
- Child: 10 mg/kg 3 times a day

Sclerosing cholangitis

► BY MOUTH

- Child: 5–10 mg/kg 2–3 times a day (max. per dose 15 mg/kg 3 times a day), adjusted according to response

● **UNLICENSED USE** Not licensed for use in children for the treatment of cholestasis, sclerosing cholangitis, cholestasis associated with total parenteral nutrition or the improvement of hepatic metabolism of essential fatty acids and bile flow in cystic fibrosis.

● **CONTRA-INDICATIONS** Acute inflammation of the gall bladder · frequent episodes of biliary colic · inflammatory diseases and other conditions of the colon, liver or small intestine which interfere with enterohepatic circulation of bile salts · non-functioning gall bladder · radio-opaque stones

● **INTERACTIONS** → Appendix 1: ursodeoxycholic acid

● **SIDE-EFFECTS**

- **Common or very common** Diarrhoea · pale faeces
- **Rare or very rare** Abdominal pain upper · cholelithiasis calcification · hepatic cirrhosis exacerbated · skin reactions
- **Frequency not known** Nausea · vomiting

● **PREGNANCY** No evidence of harm but manufacturer advises avoid.

● **BREAST FEEDING** Not known to be harmful but manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Avoid in chronic liver disease (but used in primary biliary cirrhosis).

● **PATIENT AND CARER ADVICE** Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).

LIPIDS › STEROLS

Cholesterol

12-Aug-2020

● **INDICATIONS AND DOSE**

Smith-Lemli-Opitz syndrome

► BY MOUTH

- Neonate: 5–10 mg/kg 3–4 times a day.
- Child: 5–10 mg/kg 3–4 times a day, doses up to 15 mg/kg 4 times daily have been used

● **UNLICENSED USE** Not licensed.

● **CONTRA-INDICATIONS** For contra-indications, consult product literature.

● **CAUTIONS** For advice on cautions, consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Expert sources advise cholesterol powder can be mixed with a vegetable oil before administration.

● **MEDICINAL FORMS** Forms available from special-order manufacturers include: oral suspension, powder

8.2 Oesophageal varices

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES › VASOPRESSIN AND ANALOGUES

Terlipressin acetate

22-Apr-2021

- **INDICATIONS AND DOSE**

GLYPRESSIN ® INJECTION

Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices (specialist use only)

- BY INTRAVENOUS INJECTION
- Child 12–17 years (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours
- Child 12–17 years (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours

VARIQUEL ® INJECTION

Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices (specialist use only)

- BY INTRAVENOUS INJECTION
- Child 12–17 years (body-weight up to 50 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Child 12–17 years (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Child 12–17 years (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute

- **UNLICENSED USE** Unlicensed for use in children.
- **CAUTIONS** Arrhythmia · electrolyte and fluid disturbances · heart disease · history of QT-interval prolongation · respiratory disease · septic shock · uncontrolled hypertension · vascular disease
- **SIDE-EFFECTS**
- **Common or very common** Abdominal cramps · arrhythmias · diarrhoea · headache · hypertension · hypotension · pallor · peripheral ischaemia · vasoconstriction
- **Uncommon** Chest pain · cyanosis · fluid overload · heart failure · hot flush · hyponatraemia · intestinal ischaemia · ischaemic heart disease · lymphangitis · myocardial infarction · nausea · pulmonary oedema · respiratory disorders · seizure · skin necrosis · uterine disorders · vomiting
- **Rare or very rare** Dyspnoea · hyperglycaemia · stroke
- **PREGNANCY** Avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported.
- **BREAST FEEDING** Avoid unless benefits outweigh risk—no information available.
- **RENAL IMPAIRMENT** EvGr Use with caution in chronic renal failure. M

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Glypressin** (Ferring Pharmaceuticals Ltd)
  Terlipressin acetate 120 microgram per 1 ml Glypressin 1mg/8.5ml solution for injection ampoules | 5 ampoule PoM (Hospital only)
- **Variquel** (Alliance Pharmaceuticals Ltd)
  Terlipressin acetate 200 microgram per 1 ml Variquel 1mg/5ml solution for injection vials | 5 vial PoM £89.98 (Hospital only)

Vasopressin

05-Oct-2021

(Antidiuretic hormone (ADH))

- **DRUG ACTION** Vasopressin is an endogenous hormone with a direct antidiuretic effect on the kidney; it is given in the synthetic form of argipressin.

- **INDICATIONS AND DOSE**

Adjunct in acute massive haemorrhage of gastrointestinal tract or oesophageal varices (specialist use only)

- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: Initially 0.3 unit/kg (max. per dose 20 units), dose to be administered over 20–30 minutes, then 0.3 unit/kg/hour, adjusted according to response (max. per dose 1 unit/kg/hour), if bleeding stops, continue at same dose for 12 hours, then withdraw gradually over 24–48 hours; max. duration of treatment 72 hours, dose may alternatively be infused directly into the superior mesenteric artery, dose expressed as argipressin

DOSE EQUIVALENCE AND CONVERSION

- Argipressin 1 unit is equivalent to vasopressin 1 unit.

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Chronic nephritis (until reasonable blood nitrogen concentrations attained) · vascular disease (especially disease of coronary arteries) unless extreme caution
- **CAUTIONS** Asthma · avoid fluid overload · conditions which might be aggravated by water retention · epilepsy · heart failure · hypertension · migraine
- **SIDE-EFFECTS** Abdominal pain · angina pectoris · bronchospasm · cardiac arrest · chest pain · diarrhoea · flatulence · fluid imbalance · gangrene · headache · hyperhidrosis · hypertension · musculoskeletal chest pain · nausea · pallor · peripheral ischaemia · tremor · urticaria · vertigo · vomiting
- **PREGNANCY** Oxytocic effect in third trimester.
- **BREAST FEEDING** Not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (argipressin); expert sources advise dilute with Glucose 5% or Sodium Chloride 0.9% to a concentration of 0.2–1 unit/mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- **Vasopressin (Non-proprietary)**
  Argipressin 20 unit per 1 ml Argipressin 20units/1ml solution for injection ampoules | 10 ampoule PoM £754.86-£950.00 (Hospital only)

9 Obesity

Obesity

01-Jun-2016

Description of condition

Obesity is directly linked to many health problems including cardiovascular disease, type 2 diabetes, and obstructive sleep apnoea syndrome. It can also contribute to psychological and psychiatric morbidities.

In children and adolescents, body mass index (BMI) should be used as a practical estimation of body fat. However, it should be interpreted with caution as it is not a direct measure of adiposity. Assessing the BMI of children is more complicated than for adults because it changes as they grow and mature, with different growth patterns seen between boys and girls.

Public Health England advises that the British 1990 (UK90) growth reference charts should be used to determine the weight status of children. A child ≥ the 91st centile is classified as overweight, and as obese if ≥ the 98th centile. Waist circumference is not recommended as a routine measure, but should be used as an additional predictor for risk of developing other long-term health problems. Children who are overweight or obese and have significant comorbidities or complex needs should be considered for specialist referral.

Aims of treatment

Children who are overweight or obese and are no longer growing taller will ultimately need to lose weight and maintain weight loss to improve their BMI. However, preventing further weight gain while making lifestyle changes, may be an appropriate short-term aim.

Overview

EvGr The goals of management of obesity should be agreed together with the child and their parents or carers; parents or carers should be encouraged to take responsibility for lifestyle changes of their children. Referral to a specialist can be considered for children who are overweight or obese and have significant comorbidities or complex needs (e.g. learning disabilities). Children should be assessed for comorbidities such as hypertension, hyperinsulinaemia, dyslipidaemia, type 2 diabetes, psychosocial dysfunction, and exacerbation of conditions such as asthma.

An initial assessment should consider potential underlying causes (e.g. hypothyroidism) and a review of the appropriateness of current medications, which are known to cause weight gain, e.g. atypical antipsychotics, beta-adrenoceptor blocking drugs, insulin (when used in the treatment of type 2 diabetes), sodium valproate, and tricyclic antidepressants. A

Lifestyle changes

EvGr Obese children should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity and improve diet and eating behaviour. These changes should be encouraged within the whole family. Any dietary changes should be age appropriate and consistent with healthy eating recommendations. Surgical intervention is not generally recommended in children or adolescents. A

Drug treatment

EvGr Drug treatment is not generally recommended for children younger than 12 years, unless there are exceptional circumstances, such as if severe comorbidities are present. In children over 12 years, drug treatment is only recommended if physical comorbidities, such as orthopaedic problems or sleep apnoea, or severe psychological comorbidities are present. Drug treatment should **never** be used as the sole element of treatment and should be used as part of an overall weight management plan. Orlistat below [unlicensed use] is the only drug currently available in the UK that is recommended specifically for the treatment of obesity; it acts by reducing the absorption of dietary fat. Treatment should be started and monitored in a specialist paediatric setting by experienced multidisciplinary teams. An initial 6–12 month trial is recommended, with regular review to assess effectiveness, adverse effects and adherence.

Treatment may also be used to maintain weight loss rather than to continue to lose weight. A vitamin and mineral supplement may also be considered if there is concern about inadequate micronutrient intake, particularly for younger children who need vitamins and minerals for growth and development. A

PERIPHERALLY ACTING ANTIOBESITY PRODUCTS › LIPASE INHIBITORS

Orlistat

- **DRUG ACTION** Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

- **INDICATIONS AND DOSE**

Adjunct in obesity

- BY MOUTH
- Child 12–17 years (initiated by a specialist): 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only under specialist supervision, if a meal is missed or contains no fat, the dose of orlistat should be omitted

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Cholestasis · chronic malabsorption syndrome
- **CAUTIONS** Chronic kidney disease · may impair absorption of fat-soluble vitamins · volume depletion

  CAUTIONS, FURTHER INFORMATION Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.
- **INTERACTIONS** → Appendix 1: orlistat
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain (may be minimised by reduced fat intake) · anxiety · diarrhoea · gastrointestinal disorders
  - **Frequency not known** Anorectal haemorrhage · bullous dermatitis · cholelithiasis · diverticulitis · hepatitis · oxalate nephropathy · pancreatitis · renal failure
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Avoid—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

10 Rectal and anal disorders

10.1 Anal fissures

Anal fissure

31-Aug-2016

Description of condition

An anal fissure is a tear or ulcer in the lining of the anal canal, immediately within the anal margin. Clinical features of anal fissure include bleeding and persistent pain on defecation, and a linear split in the anal mucosa. Constipation (passage of hard stools) is the most common cause in children. The majority of anal fissures are posterior, and an underlying cause should be considered (secondary anal fissure) if fissures are multiple, occur laterally, and are refractory to treatment.

EvGr Suspect sexual abuse if a child has an anal fissure, and if constipation, Crohn's disease or passing hard stools have been excluded as the cause (see also *Useful resources* below). A

Aims of treatment

The aim of treatment is to relieve pain and promote healing of the fissure.

Drug treatment

EvGr Initial management of acute anal fissures should focus on ensuring that stools are soft and easily passed. Osmotic laxatives, such as lactulose p. 44 or macrogols (macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 44), are recommended. A simple analgesic (such as paracetamol p. 302 or ibuprofen p. 747, may be offered for prolonged burning pain following defecation.

Children should be referred to a paediatric specialist if the anal fissure has not healed following two weeks of initial management, or earlier if there is significant pain. A

Useful Resources

Child maltreatment: when to suspect maltreatment in under 18s. National Institute for Health and Care Excellence. Clinical guideline 89. July 2009.
www.nice.org.uk/guidance/cg89

10.2 Haemorrhoids

Haemorrhoids

01-Dec-2016

Description of condition

Haemorrhoids, or piles, are abnormal swellings of the vascular mucosal anal cushions around the anus. Internal haemorrhoids arise above the dentate line and are usually painless unless they become strangulated. External haemorrhoids originate below the dentate line and can be itchy or painful. Haemorrhoids in children are rare but may occur in infants with portal hypertension.

Aims of treatment

The aims of treatment are to reduce the symptoms (pain, bleeding and swelling), promote healing, and prevent recurrence.

Non-drug treatment

EvGr Stools should be kept soft and easy to pass (to minimise straining) by increasing dietary fibre and fluid intake. Advice about perianal hygiene is helpful to aid healing and reduce irritation and itching. A

Drug treatment

EvGr If constipation is present, it should be treated, see Constipation p. 41.

A simple analgesic, such as paracetamol p. 302, can be used for pain relief. NSAIDs should be avoided if rectal bleeding is present.

Symptomatic treatment with a locally applied preparation is appropriate for short periods. E Manufacturer advises preparations containing local anaesthetics (lidocaine, cinchocaine, and pramocaine [unlicensed]) should only be used for a few days as they may cause sensitisation of the anal skin— local anaesthetic ointments can be absorbed through the rectal mucosa (with a theorectical risk of systemic effects) and very rarely may cause increased irritation; excessive application should be **avoided** in infants and children.

Topical preparations combining corticosteroids with local anaesthetics and soothing agents are available for the management of haemorrhoids. Manufacturer advises long-term use of corticosteroid creams can cause ulceration and permanent damage due to thinning of the perianal skin and should be avoided. Continuous or excessive use carries a risk of adrenal suppression and systemic corticosteroid effects (particularly in infants).

EvGr Topical preparations containing corticosteroids must not be used if infection is present (such as perianal streptococcal infection, *herpes simplex* or perianal thrush).

Recurrent symptoms, should be referred to secondary care for further investigation and management. E

Related drugs

Topical preparations used for haemorrhoids: lidocaine hydrochloride p. 937, benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide below, cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate p. 75, cinchocaine with hydrocortisone p. 76, cinchocaine with prednisolone p. 77.

CORTICOSTEROIDS

Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide

08-Mar-2022

INDICATIONS AND DOSE

Haemorrhoids | Pruritus ani

- BY RECTUM USING OINTMENT
- Child 12–17 years: Apply twice daily for no longer than 7 days, to be applied morning and night, an additional dose should be applied after a bowel movement
- BY RECTUM USING SUPPOSITORIES
- Child 12–17 years: 1 suppository twice daily for no longer than 7 days, to be inserted night and morning, additional dose after a bowel movement

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 500.

PAEDIATRIC STEROID TREATMENT CARD FOR CHILDREN WITH ADRENAL INSUFFICIENCY (NOVEMBER 2020)

The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any

healthcare professional managing such patients. The BSPED Paediatric Steroid Treatment Card is available at: www.endocrinology.org/adrenal-crisis.

MHRA/CHM ADVICE: TOPICAL CORTICOSTEROIDS: INFORMATION ON THE RISK OF TOPICAL STEROID WITHDRAWAL REACTIONS (SEPTEMBER 2021)

Rarely, long-term continuous or inappropriate use of topical corticosteroids, particularly those of moderate to high potency, can result in the development of rebound flares, reported as dermatitis with intense redness, stinging, and burning that can spread beyond the initial treatment area.

The MHRA advises that the lowest potency topical corticosteroid needed should be used. For patients who are currently on long-term topical corticosteroid treatment, consider reducing potency or frequency of application (or both). Healthcare professionals should also be vigilant for the signs and symptoms of topical corticosteroid withdrawal reactions and review the position statement from the National Eczema Society and British Association of Dermatologists eczema.org/wp-content/uploads/Topical-Steroid-Withdrawal-position-statement.pdf.

Healthcare professionals should inform patients:

- how much should be applied, as under-use can prolong treatment duration;
- how long they should use a topical corticosteroid for, especially on sensitive areas such as the face and genitals;
- to always apply topical corticosteroids as instructed and consult the patient information leaflet provided;
- to seek medical advice before using a topical corticosteroid on a new body area, as some areas of the body are more prone to side-effects;
- to return for medical advice if their skin condition worsens while using topical corticosteroid, and advise them when it would be appropriate to re-treat without a consultation and;
- if their skin worsens within 2 weeks of stopping a topical corticosteroid, treatment should not be started again without consulting their doctor unless they have previously been advised to do so

The MHRA advises healthcare professionals to report any suspected adverse effects, via the Yellow Card Scheme, even when the adverse affects occur after stopping corticosteroid treatment.

- **CONTRA-INDICATIONS** Infection—consult product literature
- **SIDE-EFFECTS** Skin reactions · vision disorders
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** A proprietary brand *Anusol Plus HC*® (ointment and suppositories) is on sale to the public.
- **PATIENT AND CARER ADVICE** If systemic absorption occurs following topical or local use, side-effects applicable to systemic corticosteroids may apply; a patient information leaflet should be supplied and the need for a Steroid Treatment Card considered, see Corticosteroids, general use p. 500.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ointment

- **Anusol-Hc** (Church & Dwight UK Ltd)
  Hydrocortisone acetate 2.5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Benzyl benzoate 12.5 mg per 1 gram, Peru Balsam 18.75 mg per 1 gram, Bismuth subgallate 22.5 mg per 1 gram, Zinc oxide 107.5 mg per 1 gram Anusol HC ointment | 30 gram PoM £2.49

Suppository

- **Anusol-Hc** (Church & Dwight UK Ltd)
  Hydrocortisone acetate 10 mg, Bismuth oxide 24 mg, Benzyl benzoate 33 mg, Peru Balsam 49 mg, Bismuth subgallate 59 mg, Zinc oxide 296 mg Anusol HC suppositories | 12 suppository PoM £3.84

Cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate

08-Mar-2022

- **INDICATIONS AND DOSE**

Haemorrhoids | Pruritus ani

- BY RECTUM USING OINTMENT
- Child: Apply twice daily for 5–7 days, apply 3–4 times a day if required, on the first day of treatment, then apply once daily for a few days after symptoms have cleared
- BY RECTUM USING SUPPOSITORIES
- Child 12-17 years: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement, then 1 suppository once daily on alternate days for 1 week

Haemorrhoids (severe cases) | Pruritus ani (severe cases)

- BY RECTUM USING SUPPOSITORIES
- Child 12-17 years: Initially 1 suppository 2–3 times a day for 5–7 days, then 1 suppository once daily on alternate days for 1 week

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

11 Stoma care

Stoma care

17-Mar-2021

Description of condition

A stoma is an artificial opening on the abdomen to divert flow of faeces or urine into an external pouch located outside of the body. This procedure may be temporary or permanent. Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejunostomy, duodenostomy, or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient's pharmaceutical needs correctly.

Prescribing in patients with stoma

Prescribing for patients with a stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release medicines are **unsuitable**, particularly in patients with an ileostomy, as there may be insufficient release of the active ingredient. Preparation forms with quick dissolution and absorption should be used. Liquids, capsules, and uncoated or soluble tablets are usually well absorbed. When a solid-dose form such as a capsule or a tablet is given, the contents of the stoma bag should be checked for any remnants.

Preparations containing sorbitol as an excipient may have a laxative effect.

Opioid **analgesics** may cause constipation in colostomy patients. Aspirin and NSAIDs may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

The effect of **antacids** in patients with a stoma is dependent on the class of antacids and the type of stoma. Calcium-containing antacids can cause constipation and magnesium-containing antacids can cause diarrhoea, especially in patients with an ileostomy as they can cause osmotic diarrhoea. The aluminium hydroxide antacids can cause constipation and may be of concern in colostomy patients.

The **antidiarrhoeal** drugs, loperamide hydrochloride p. 52 and codeine phosphate p. 308, reduce intestinal motility and

decrease water and sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel.

Patients with a stoma are particularly susceptible to fluid and sodium depletion which can often lead to hypokalaemia; potassium supplements are not usually required. Hypokalaemia may cause an increased sensitivity to digoxin p. 86.

Diuretics may cause excessive dehydration in patients with an ileostomy or with urostomy and potassium depletion may easily occur; potassium-sparing diuretics are available.

Iron preparations may cause diarrhoea in ileostomy patients, constipation in colostomy patients, and sore skin if output leaks; stools may also appear black. Parenteral iron is licensed for use in patients who are unable to tolerate gastro-intestinal adverse effects of oral iron.

Laxatives may cause rapid and severe loss of water and electrolytes in ileostomy patients and are, therefore, used with caution. In colostomy patients, bulk-forming laxatives may provide more benefit than a stimulant laxative; they aid in the formation of solid stools and promote regularity. Stool softeners can also help with constipation.

Liquid formulations of potassium supplements are preferred to modified-release formulations; to avoid osmotic diarrhoea, the daily dose is split into divided doses.

Care of stoma

Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

Chapter 2
Cardiovascular system

CONTENTS

1 Arrhythmias

Arrhythmias

05-May-2021

Overview

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia; electrocardiography and referral to a paediatric cardiologist is essential; underlying causes such as heart failure require appropriate treatment.

Bradycardia

Adrenaline/epinephrine p. 149 is useful in the treatment of symptomatic bradycardia in an infant or child.

Supraventricular tachycardia

In supraventricular tachycardia adenosine p. 85 is given by rapid intravenous injection. If adenosine is ineffective, intravenous amiodarone hydrochloride p. 83, flecainide acetate p. 82, or a beta-blocker (such as esmolol hydrochloride p. 119) can be tried; verapamil hydrochloride p. 122 can also be considered in children over 1 year. Atenolol p. 118, sotalol hydrochloride p. 85 and flecainide acetate are used for the prophylaxis of paroxysmal supraventricular tachycardias.

The use of d.c. shock and vagal stimulation also have a role in the treatment of supraventricular tachycardia.

Syndromes associated with accessory conducting pathways

Amiodarone hydrochloride, flecainide acetate, or a beta-blocker is used to prevent recurrence of supraventricular tachycardia in infants and young children with these syndromes (e.g. Wolff-Parkinson-White syndrome).

Atrial flutter

In atrial flutter without structural heart defects, sinus rhythm is restored with d.c. shock or cardiac pacing; drug treatment is usually not necessary. Amiodarone hydrochloride is used in atrial flutter when structural heart defects are present or after heart surgery. Sotalol hydrochloride may also be considered.

Atrial fibrillation

Atrial fibrillation is very rare in children. To restore sinus rhythm d.c. shock is used; beta-blockers, alone or together with digoxin p. 86 may be useful for ventricular rate control.

Ectopic tachycardia

Intravenous amiodarone hydrochloride is used in conjunction with body cooling and synchronised pacing in postoperative junctional ectopic tachycardia. Oral amiodarone hydrochloride or flecainide acetate are used in congenital junctional ectopic tachycardia.

Amiodarone hydrochloride, flecainide acetate, or a beta-blocker are used in atrial ectopic tachycardia; amiodarone hydrochloride is preferred in those with poor ventricular function.

Ventricular tachycardia and ventricular fibrillation

Pulseless ventricular tachycardia or ventricular fibrillation require resuscitation, see Paediatric Advanced Life Support Algorithm in Life support algorithm (image) inside back cover. Amiodarone hydrochloride is used in resuscitation for pulseless ventricular tachycardia or ventricular fibrillation unresponsive to defibrillation; lidocaine hydrochloride p. 81 can be used as an alternative.

Amiodarone hydrochloride is also used in a haemodynamically stable child when drug treatment is required; lidocaine hydrochloride can be used as an alternative only if amiodarone hydrochloride is not available.

Torsade de pointes

Torsade de pointes is a form of ventricular tachycardia associated with long QT syndrome, which may be congenital or drug induced. Episodes may be self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous magnesium sulfate can be used to treat torsade de pointes (dose recommendations vary—consult local guidelines). Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Anti-arrhythmic drugs

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)
- Class II: beta-blockers
- Class III: amiodarone; sotalol (also Class II)
- Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Adenosine is the treatment of choice for terminating supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It is also used in the diagnosis of supraventricular arrhythmias. It is not negatively inotropic and does not cause significant hypotension. The injection should be administered by rapid intravenous injection into a central or large peripheral vein.

Amiodarone hydrochloride is useful in the management of both supraventricular and ventricular tachyarrhythmias. It can be given by intravenous infusion and by mouth, and causes little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly. Intravenous amiodarone hydrochloride is also used in cardiopulmonary resuscitation for ventricular fibrillation or pulseless ventricular tachycardia unresponsive to defibrillation.

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses may cause nausea unless divided). Many weeks or months may be required to achieve steady state plasma-amiodarone concentration; this is particularly important when drug interactions are likely.

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. Sotalol hydrochloride has a role in the management of ventricular arrhythmias.

Oral administration of digoxin slows the ventricular rate in atrial fibrillation and in atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate.

Flecainide acetate is useful for the treatment of resistant re-entry supraventricular tachycardia, ventricular tachycardia, ventricular ectopic beats, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), and paroxysmal atrial fibrillation. Flecainide acetate crosses the placenta and can be used to control fetal supraventricular arrhythmias.

Lidocaine hydrochloride can be used as an alternative to amiodarone hydrochloride for cardiopulmonary resuscitation in children with ventricular fibrillation or pulseless ventricular tachycardia unresponsive to defibrillation. Doses may need to be reduced in children with persistently poor cardiac output and hepatic or renal failure.

Verapamil hydrochloride can cause severe haemodynamic compromise (refractory hypotension and cardiac arrest) when used for the acute treatment of arrhythmias in neonates and infants; it is contra-indicated in children under 1 year. It is also contra-indicated in those with congestive heart failure, syndromes associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) and in most receiving concomitant beta-blockers. It can be useful in older children with supraventricular tachycardia.

Advanced Pharmacy Services

Children with an arrhythmia may be eligible for the New Medicines Service / Medicine Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

Other drugs used for Arrhythmias Metoprolol tartrate, p. 119

ANTIARRHYTHMICS › CLASS IB

Lidocaine hydrochloride

10-Nov-2020

(Lignocaine hydrochloride)

- **INDICATIONS AND DOSE**

Ventricular arrhythmias | Pulseless ventricular tachycardia | Ventricular fibrillation

► INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAOSSEOUS INJECTION

- Neonate: Initially 0.5–1 mg/kg, followed immediately by (by intravenous infusion) 0.6–3 mg/kg/hour, alternatively (by intravenous injection or by intraosseous injection) 0.5–1 mg/kg repeated at intervals of not less than 5 minutes if infusion is not immediately available following initial injection, until infusion can be initiated; maximum 3 mg/kg per course.
- Child 1 month–11 years: Initially 0.5–1 mg/kg, followed immediately by (by intravenous infusion) 0.6–3 mg/kg/hour, alternatively (by intravenous injection or by intraosseous injection) 0.5–1 mg/kg repeated at intervals of not less than 5 minutes if infusion is not immediately available following initial injection, until infusion can be initiated; maximum 3 mg/kg per course
- Child 12–17 years: Initially 50–100 mg, followed by (by intravenous infusion) 120 mg, dose to be given over 30 minutes, then (by intravenous infusion) 240 mg, dose to be given over 2 hours, then (by intravenous infusion) 60 mg/hour, reduce dose further if infusion is continued beyond 24 hours, if infusion not immediately available following initial injection, the initial injection dose may be repeated at intervals of not less than 5 minutes (to a maximum 300 mg dose in 1 hour) until infusion can be initiated

Neonatal seizures

► BY INTRAVENOUS INFUSION

- Neonate: Initially 2 mg/kg, dose to be given over 10 minutes, followed by 6 mg/kg/hour for 6 hours; reduced to 4 mg/kg/hour for 12 hours, then reduced to 2 mg/kg/hour for a further 12 hours, preterm neonates may require lower doses.

- **UNLICENSED USE** Not licensed for use in children under 1 year.
- **CONTRA-INDICATIONS** All grades of atrioventricular block · severe myocardial depression · sino-atrial disorders
- **CAUTIONS** Acute porphyrias p. 688 (consider infusion with glucose for its anti-porphyrinogenic effects) · congestive cardiac failure (consider lower dose) · post cardiac surgery (consider lower dose)
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **SIDE-EFFECTS** Anxiety · arrhythmias · atrioventricular block · cardiac arrest · circulatory collapse · confusion · dizziness · drowsiness · euphoric mood · headache · hypotension (may lead to cardiac arrest) · loss of consciousness · methaemoglobinaemia · muscle twitching · myocardial contractility decreased · nausea · neurological effects · nystagmus · pain · psychosis · respiratory disorders · seizure · sensation abnormal · temperature sensation altered · tinnitus · tremor · vision blurred · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Methaemoglobinaemia Methylthioninium chloride can be used for the acute symptomatic treatment of drug-induced methaemoglobinaemia.

- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
  Dose adjustments Manufacturer advises slower infusion rate.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- **MONITORING REQUIREMENTS** Monitor ECG and have resuscitation facilities available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, expert sources advise dilute with Glucose 5% or Sodium Chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- **Lidocaine hydrochloride (Non-proprietary)**

Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule PoM £10.00 DT = £10.00

Lidocaine hydrochloride 10 mg per 1 ml Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule PoM £13.80 | 100 ampoule PoM £61.26

Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule PoM £5.00–£6.55 DT = £5.00 | 20 ampoule PoM £192.20 (Hospital only)

Lidocaine 200mg/20ml (1%) solution for injection vials | 10 vial PoM £22.00–£26.40 DT = £26.40

Lidocaine 200mg/20ml (1%) solution for injection ampoules | 1 ampoule PoM £20.97 (Hospital only) | 10 ampoule PoM £10.00–£14.00 DT = £14.00 | 20 ampoule PoM £419.40 (Hospital only)

Lidocaine 50mg/5ml (1%) solution for injection ampoules | 1 ampoule PoM £6.55 (Hospital only) | 10 ampoule PoM £3.00–£4.00 DT = £3.00 | 20 ampoule PoM £131.00 (Hospital only)

Lidocaine 200mg/20ml (1%) solution for injection Mini-Plasco ampoules | 100 ampoule PoM

Lidocaine 20mg/2ml (1%) solution for injection ampoules | 10 ampoule PoM £3.50 DT = £2.50

Lidocaine 50mg/5ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule PoM £8.05

Lidocaine hydrochloride 20 mg per 1 ml Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule PoM £3.20–£4.40 DT = £3.20 | 20 ampoule PoM £131.00 (Hospital only)

Lidocaine 400mg/20ml (2%) solution for injection vials | 10 vial PoM £23.00–£27.50 DT = £27.50

Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco ampoules | 100 ampoule PoM £81.69

Lidocaine 400mg/20ml (2%) solution for injection Mini-Plasco ampoules | 100 ampoule PoM

Lidocaine 40mg/2ml (2%) solution for injection ampoules | 10 ampoule PoM £4.00 DT = £2.70

Lidocaine 100mg/5ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule PoM £9.40

Lidocaine 200mg/10ml (2%) solution for injection ampoules | 20 ampoule PoM £317.20 DT = £14.95 (Hospital only)

Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule PoM £11.00–£13.64 DT = £13.64 | 20 ampoule PoM £432.40 (Hospital only)

ANTIARRHYTHMICS › CLASS IC

Flecainide acetate

08-Feb-2021

- **INDICATIONS AND DOSE**

Resistant re-entry supraventricular tachycardia | Ventricular ectopic beats or ventricular tachycardia | Arrhythmias associated with accessory conduction pathways (e.g. Wolff-Parkinson-White syndrome) | Paroxysmal atrial fibrillation (initiated under direction of hospital consultant)

▸ BY MOUTH

▸ Neonate: 2 mg/kg 2–3 times a day, adjusted according to response, also adjust dose according to plasma-flecainide concentration.

▸ Child 1 month-11 years: 2 mg/kg 2–3 times a day, adjusted according to response, also adjust dose according to plasma-flecainide concentration; maximum 8 mg/kg per day; maximum 300 mg per day

▸ Child 12–17 years: Initially 50–100 mg twice daily; increased if necessary up to 300 mg daily, maximum 400 mg daily for ventricular arrhythmias in heavily built children

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▸ Manufacturer advises reduce dose by half with concurrent use of amiodarone.

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS** Abnormal left ventricular function · atrial conduction defects (unless pacing rescue available) · bundle branch block (unless pacing rescue available) · distal block (unless pacing rescue available) · haemodynamically significant valvular heart disease · heart failure · history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia · long-standing atrial fibrillation where conversion to sinus rhythm not attempted · second-degree or greater AV block (unless pacing rescue available) · sinus node dysfunction (unless pacing rescue available)
- **CAUTIONS** Atrial fibrillation following heart surgery · patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **SIDE-EFFECTS**

▸ **Common or very common** Arrhythmias · asthenia · dizziness · dyspnoea · fever · oedema · vision disorders

▸ **Uncommon** Alopecia · appetite decreased · constipation · diarrhoea · flatulence · gastrointestinal discomfort · nausea · skin reactions · vomiting

▸ **Rare or very rare** Anxiety · confusion · corneal deposits · depression · drowsiness · flushing · hallucination · headache · hepatic disorders · hyperhidrosis · inflammation · insomnia · memory loss · movement disorders · peripheral neuropathy · photosensitivity reaction · respiratory disorders · seizure · sensation abnormal · syncope · tinnitus · tremor · vertigo

▸ **Frequency not known** Altered pacing threshold · atrioventricular block · cardiac arrest · chest pain · heart failure · hypotension · palpitations · QT interval prolongation

- **PREGNANCY** Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in *animal* studies; infant hyperbilirubinaemia also reported.
- **BREAST FEEDING** Significant amount present in milk but not known to be harmful.

- **HEPATIC IMPAIRMENT**
  Dose adjustments Avoid or reduce dose in severe impairment.
  Monitoring Monitor plasma-flecainide concentration.
- **RENAL IMPAIRMENT**
  Dose adjustments Reduce dose by 25–50% if estimated glomerular filtration rate less than 35 mL/minute/1.73 m^2.
  Monitoring Monitor plasma-flecainide concentration.
- **MONITORING REQUIREMENTS**
  - Plasma-flecainide concentration for optimal response 200–800 micrograms/litre; blood sample should be taken immediately before next dose.
- **DIRECTIONS FOR ADMINISTRATION** EvGr For administration *by mouth*, take on an empty stomach; milk, infant formula, and dairy products may reduce absorption of flecainide. M Liquid has a local anaesthetic effect. Do not store liquid in refrigerator.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Flecainide for arrhythmias
  www.medicinesforchildren.org.uk/medicines/flecainide-for-arrhythmias/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Flecainide acetate (Non-proprietary)**
  Flecainide acetate 50 mg Flecainide 50mg tablets | 60 tablet PoM £7.68 DT = £2.53
  Flecainide acetate 100 mg Flecainide 100mg tablets | 60 tablet PoM £8.06 DT = £3.58

ANTIARRHYTHMICS › CLASS III

Amiodarone hydrochloride

22-Apr-2022

- **INDICATIONS AND DOSE**

Supraventricular and ventricular arrhythmias (initiated in hospital or under specialist supervision)

- BY MOUTH
  - Neonate: Initially 5–10 mg/kg twice daily for 7–10 days, then reduced to 5–10 mg/kg daily.
  - Child 1 month-11 years: Initially 5–10 mg/kg twice daily (max. per dose 200 mg) for 7–10 days, then reduced to 5–10 mg/kg once daily; maximum 200 mg per day
  - Child 12–17 years: 200 mg 3 times a day for 1 week, then 200 mg twice daily for 1 week, then usually 200 mg daily adjusted according to response
- INITIALLY BY INTRAVENOUS INFUSION
  - Neonate: Initially 5 mg/kg, then (by intravenous infusion) 5 mg/kg every 12–24 hours, dose to be given over 30 minutes.
  - Child: Initially 5–10 mg/kg, dose to be given over 20 minutes to 2 hours, then (by continuous intravenous infusion) 300 micrograms/kg/hour, adjusted according to response; (by continuous intravenous infusion) increased if necessary up to 1.5 mg/kg/hour; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (for cardiopulmonary resuscitation)

- BY INTRAVENOUS INJECTION
  - Neonate: 5 mg/kg, dose to be given over at least 3 minutes, dose can be repeated **once** if required. Consult Resuscitation Council (UK) guidelines for further details.
  - Child: 5 mg/kg (max. per dose 300 mg), dose to be given over at least 3 minutes, dose can be repeated **once** if required. Consult Resuscitation Council (UK) guidelines for further details

- **UNLICENSED USE** Not licensed for use in children under 3 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SOFOSBUVIR WITH DACLATASVIR; SOFOSBUVIR AND LEDIPASVIR (MAY 2015); SIMEPREVIR WITH SOFOSBUVIR (AUGUST 2015): RISK OF SEVERE BRADYCARDIA AND HEART BLOCK WHEN TAKEN WITH AMIODARONE

Avoid concomitant use unless other antiarrhythmics cannot be given.

MHRA/CHM ADVICE: AMIODARONE (*CORDARONE X*®): REMINDER OF RISKS OF TREATMENT AND NEED FOR PATIENT MONITORING AND SUPERVISION (MARCH 2022)

Healthcare professionals are reminded that amiodarone can cause serious adverse reactions affecting the eyes, heart, lung, liver, thyroid gland, skin, and peripheral nervous system that may persist for a month or longer after treatment discontinuation. Some of these reactions may be life-threatening but onset can be delayed; patients should be supervised and reviewed regularly, especially those on long-term treatment. Liver and thyroid function tests should be performed—see *Monitoring requirements*.

Patients and carers should be counselled to seek medical advice if new or worsening respiratory symptoms develop; healthcare professionals should consider using computerised tomography (CT) scans if pulmonary toxicity is suspected. Patients and carers should also be advised to seek immediate medical attention if other symptoms of serious adverse reactions develop during or after stopping treatment.

- **CONTRA-INDICATIONS**

GENERAL CONTRA-INDICATIONS Avoid in severe conduction disturbances (unless pacemaker fitted) · avoid in sinus node disease (unless pacemaker fitted) · avoid rapid loading after cardiac surgery · iodine sensitivity · sino-atrial heart block (except in cardiac arrest) · sinus bradycardia (except in cardiac arrest) · thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS

- With intravenous use Avoid bolus injection in cardiomyopathy · avoid bolus injection in congestive heart failure · avoid in circulatory collapse · avoid in severe arterial hypotension · avoid in severe respiratory failure

- **CAUTIONS**

GENERAL CAUTIONS Acute porphyrias p. 688 · conduction disturbances (in excessive dosage) · heart failure · hypokalaemia · severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS

- With intravenous use Avoid benzyl alcohol containing injections in neonates · moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) · severe hepatocellular toxicity

- **INTERACTIONS** → Appendix 1: antiarrhythmics

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Arrhythmias · hepatic disorders · hyperthyroidism · nausea · respiratory disorders · skin reactions
- **Rare or very rare** Bronchospasm (in patients with severe respiratory failure) · headache · idiopathic intracranial hypertension · nerve disorders · SIADH
- **Frequency not known** Angioedema · confusion · delirium · pancreatitis · severe cutaneous adverse reactions (SCARs)

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With oral use Constipation · corneal deposits · hypothyroidism · movement disorders · photosensitivity reaction · sleep disorders · taste altered · vomiting
- With parenteral use Hypotension (following rapid injection)
- **Uncommon**
- With oral use Cardiac conduction disorders · dry mouth · myopathy (usually reversible on discontinuation) · peripheral neuropathy (usually reversible on discontinuation)
- **Rare or very rare**
- With oral use Alopecia · aplastic anaemia · epididymo-orchitis · erectile dysfunction · haemolytic anaemia · pulmonary haemorrhage · thrombocytopenia · vertigo
- With parenteral use Hot flush · hyperhidrosis
- **Frequency not known**
- With oral use Altered smell sensation · appetite decreased · parkinsonism · vasculitis
- With parenteral use Agranulocytosis · libido decreased · neutropenia

SIDE-EFFECTS, FURTHER INFORMATION Side-effects can occur at any time during treatment with, or in the months after stopping amiodarone.

Corneal microdeposits Patients taking amiodarone may develop corneal microdeposits (reversible on withdrawal of treatment). However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

Pulmonary toxicity If new or progressive shortness of breath or cough develops in patients taking amiodarone (or recently stopped), pulmonary toxicity should always be suspected. Pulmonary toxicity is usually reversible following early withdrawal of amiodarone.

- **PREGNANCY** Possible risk of neonatal goitre; use only if no alternative.
- **BREAST FEEDING** Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.
- **MONITORING REQUIREMENTS**
- EvGr Liver function tests required before treatment and then every 6 months.
- Serum potassium concentration should be measured before treatment.
- Chest x-ray required before treatment.
- Pulmonary function tests required before treatment.
- Thyroid function tests should be performed before treatment, then at 6-monthly intervals, and for several months after stopping treatment. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore triiodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis. M
- With intravenous use EvGr ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely. M

- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use EvGr Intravenous infusion via central venous catheter recommended if repeated or continuous infusion required, as infusion via peripheral veins may cause pain and inflammation. In emergency use for cardiopulmonary resuscitation, a peripheral venous route can be used if central venous access is not available; the peripheral line should be flushed liberally. M For *intravenous infusion*, manufacturer advises dilute to a concentration of not less than 600 micrograms/mL with Glucose 5%. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexphthalate (DEHP).
- With oral use For administration *by mouth*, expert sources advise tablets may be crushed and dispersed in water; injection solution should **not** be given orally (irritant).

- **PATIENT AND CARER ADVICE**

Phototoxicity Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

Concurrent sofosbuvir-containing regimens If taking amiodarone with concurrent sofosbuvir-containing regimens, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

Medicines for Children leaflet: Amiodarone for abnormal heart rhythms www.medicinesforchildren.org.uk/medicines/amiodarone-for-abnormal-heart-rhythms/

Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—corneal microdeposits may be associated with blurred vision (see *Side-effects, further information*).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 11

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- **Amiodarone hydrochloride (Non-proprietary)**

Amiodarone hydrochloride 30 mg per 1 ml Amiodarone 300mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £16.95–£23.23 DT = £20.09

Amiodarone hydrochloride 50 mg per 1 ml Amiodarone 150mg/3ml concentrate for solution for injection ampoules | 5 ampoule PoM £7.75 (Hospital only) | 10 ampoule PoM £22.70 (Hospital only)

- **Cordarone X** (Sanofi)

Amiodarone hydrochloride 50 mg per 1 ml Cordarone X 150mg/3ml solution for injection ampoules | 6 ampoule PoM £9.60 (Hospital only)

ANTIARRHYTHMICS › OTHER

Adenosine

28-Jul-2020

● **INDICATIONS AND DOSE**

Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate

▸ BY INTRAVENOUS INFUSION

▸ Child: (consult product literature)

Termination of supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) | Diagnosis of supraventricular arrhythmias

▸ BY RAPID INTRAVENOUS INJECTION

▸ Neonate: Initially 150 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes if required, dose to be repeated until tachycardia terminated or maximum single dose of 300 micrograms/kg given.

▸ Child 1-11 months: Initially 150 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes if required, dose to be repeated until tachycardia terminated or maximum single dose of 500 micrograms/kg given

▸ Child 1-11 years: Initially 100 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes if required, dose to be repeated until tachycardia terminated or maximum single dose of 500 micrograms/kg (max.12 mg) given

▸ Child 12-17 years: Initially 3 mg, followed by 6 mg after 1–2 minutes if required, followed by 12 mg after 1–2 minutes if required, in some children over 12 years 3 mg dose ineffective (e.g. if a small peripheral vein is used for administration) and higher initial dose sometimes used; however, those with *heart transplant* are **very sensitive** to the effects of adenosine, and should **not** receive higher initial doses

● **UNLICENSED USE** *Adenocor*® licensed for treatment of paroxysmal supraventricular tachycardia in children; not licensed for diagnosis in children; *Adenoscan*® not licensed in children.

● **CONTRA-INDICATIONS** Asthma · decompensated heart failure · long QT syndrome · second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted) · severe hypotension

● **CAUTIONS** Atrial fibrillation · atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase) · atrial flutter · atrial flutter with accessory pathway (conduction down anomalous pathway may increase) · autonomic dysfunction · bundle branch block · first-degree AV block · heart transplant · left main coronary artery stenosis · left to right shunt · pericardial effusion · pericarditis · QT-interval prolongation · recent myocardial infarction · severe heart failure · stenotic carotid artery disease with cerebrovascular insufficiency · stenotic valvular heart disease · uncorrected hypovolaemia

● **INTERACTIONS** → Appendix 1: antiarrhythmics

● **SIDE-EFFECTS**

▸ **Common or very common** Abdominal discomfort · arrhythmias · atrioventricular block · chest discomfort · chest pain (discontinue) · dizziness · dry mouth · dyspnoea · flushing · headache · hypotension (discontinue if severe) · pain · paraesthesia · throat discomfort

▸ **Uncommon** Asthenia · back discomfort · bradycardia (discontinue if asystole or severe bradycardia occur) · hyperhidrosis · limb discomfort · nervousness · taste metallic

▸ **Rare or very rare** Drowsiness · nasal congestion · nipple tenderness · respiratory disorders · respiratory failure (discontinue) · tinnitus · tremor · urinary urgency · vision blurred

▸ **Frequency not known** Apnoea · cardiac arrest · loss of consciousness · nausea · seizure · syncope · vomiting

● **PREGNANCY** Large doses may produce fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** No information available—unlikely to be present in milk owing to short half-life.

● **MONITORING REQUIREMENTS** Monitor ECG and have resuscitation facilities available.

● **DIRECTIONS FOR ADMINISTRATION** For *rapid intravenous injection*, expert sources advise give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

ELECTROLYTES: May contain Sodium

▸ **Adenosine (Non-proprietary)**
Adenosine 3 mg per 1 ml Adenosine 6mg/2ml solution for injection vials | 5 vial PoM £6.00 (Hospital only) | 6 vial PoM £26.70–£29.24 (Hospital only)

▸ **Adenocor** (Sanofi)
Adenosine 3 mg per 1 ml Adenocor 6mg/2ml solution for injection vials | 6 vial PoM £6.45 (Hospital only)

BETA-ADRENOCEPTOR BLOCKERS › NON-SELECTIVE

115

Sotalol hydrochloride

26-Jul-2021

● **INDICATIONS AND DOSE**

Life-threatening arrhythmias including ventricular tachyarrhythmias

▸ BY MOUTH

▸ Child 12-17 years: Initially 80 mg once daily, alternatively initially 40 mg twice daily, then increased to 80–160 mg twice daily, dose to be increased gradually at intervals of 2–3 days; higher doses of 480–640 mg daily may be required for life-threatening ventricular arrhythmias (under specialist supervision)

Ventricular arrhythmias, life-threatening ventricular tachyarrhythmia and supraventricular arrhythmias (initiated under specialist supervision)

▸ BY MOUTH

▸ Neonate: Initially 1 mg/kg twice daily, increased if necessary up to 4 mg/kg twice daily, dose to be increased at intervals of 3–4 days.

Atrial flutter, ventricular arrhythmias, life-threatening ventricular tachyarrhythmia and supraventricular arrhythmias (initiated under specialist supervision)

▸ BY MOUTH

▸ Child 1 month-11 years: Initially 1 mg/kg twice daily, then increased if necessary up to 4 mg/kg continued →

twice daily (max. per dose 80 mg twice daily), dose to be increased at intervals of 2–3 days

- Child 12-17 years: Initially 80 mg once daily, alternatively initially 40 mg twice daily, increased to 80–160 mg twice daily, dose to be increased gradually at intervals of 2–3 days

- **UNLICENSED USE** Not licensed for use in children under 12 years.

IMPORTANT SAFETY INFORMATION
Sotalol may prolong the QT interval, and it occasionally causes life threatening ventricular arrhythmias (**important**: manufacturer advises particular care is required to avoid hypokalaemia in patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use).
Manufacturer advises reduce dose or discontinue if corrected QT interval exceeds 550 msec.

- **CONTRA-INDICATIONS** Long QT syndrome (congenital or acquired) · torsade de pointes
- **CAUTIONS** Diarrhoea (severe or prolonged)
- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
- **Common or very common** Anxiety · arrhythmia · chest pain · dyspepsia · fever · flatulence · hearing impairment · mood altered · muscle spasms · oedema · palpitations · sexual dysfunction · taste altered · torsade de pointes (increased risk in females)
- **BREAST FEEDING** Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.
- **RENAL IMPAIRMENT** Expert sources advise avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m^2.
Dose adjustments See p. 15.
Expert sources advise halve normal dose if estimated glomerular filtration rate 30–60 mL/minute/1.73 m^2; use one-quarter normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m^2.
- **MONITORING REQUIREMENTS** Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.
- **DIRECTIONS FOR ADMINISTRATION** For administration *by mouth*, expert sources advise tablets may be crushed and dispersed in water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Cardiac glycosides

Digoxin-specific antibody

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Poisoning, emergency treatment p. 944). Digoxin-specific antibody fragments p. 953 are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine sulfate p. 921 and when measures beyond the withdrawal of digoxin below and correction of any electrolyte abnormalities are considered necessary.

Digoxin

Digoxin is most useful in the treatment of supraventricular tachycardias, especially for controlling ventricular response in persistent atrial fibrillation. Digoxin has a limited role in children with chronic heart failure.

For the management of atrial fibrillation, the maintenance dose of digoxin is determined on the basis of the ventricular rate at rest, which should not be allowed to fall below an acceptable level for the child.

Digoxin is now rarely used for rapid control of heart rate, even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is **not** recommended.

In children with heart failure who are in sinus rhythm, a loading dose may not be required.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because the symptoms of both are similar. The plasma-digoxin concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Renal function is very important in determining digoxin dosage.

Hypokalaemia predisposes the child to digitalis toxicity and should be avoided; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplements.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

Digoxin

14-Dec-2021

- **DRUG ACTION** Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

- **INDICATIONS AND DOSE**

Supraventricular arrhythmias | Chronic heart failure

- BY MOUTH

- Neonate (body-weight up to 1.5 kg): Initially 25 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- Neonate (body-weight 1.5-2.5 kg): Initially 30 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- Neonate (body-weight 2.6 kg and above): Initially 45 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- Child 1 month–1 year: Initially 45 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses
- Child 2–4 years: Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses
- Child 5–9 years: Initially 25 micrograms/kg in 3 divided doses for 24 hours, maximum 750 micrograms per day, then 6 micrograms/kg daily in 1–2 divided doses, maximum 250 micrograms per day
- Child 10–17 years: Initially 0.75–1.5 mg in 3 divided doses for 24 hours, then 62.5–250 micrograms daily in 1–2 divided doses, higher doses may be necessary

BY INTRAVENOUS INFUSION

- Neonate (body-weight up to 1.5 kg): Initially 20 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.
- Neonate (body-weight 1.5–2.5 kg): Initially 30 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.
- Neonate (body-weight 2.6 kg and above): Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.
- Child 1 month–1 year: Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses
- Child 2–4 years: Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses
- Child 5–9 years: Initially 25 micrograms/kg in 3 divided doses for 24 hours, maximum 500 micrograms per day, then 6 micrograms/kg daily in 1–2 divided doses, maximum 250 micrograms per day
- Child 10–17 years: Initially 0.5–1 mg in 3 divided doses for 24 hours, then 62.5–250 micrograms daily in 1–2 divided doses, higher doses may be necessary

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by half with concurrent use of amiodarone, dronedarone and quinine.

DOSE EQUIVALENCE AND CONVERSION

- Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks.
- When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

● **UNLICENSED USE** Digoxin is licensed for use in heart failure and supraventricular arrhythmias.

● **CONTRA-INDICATIONS** Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution) · hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution) · intermittent complete heart block · myocarditis · second degree AV block · supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) · ventricular tachycardia or fibrillation

● **CAUTIONS** Hypercalcaemia (risk of digitalis toxicity) · hypokalaemia (risk of digitalis toxicity) · hypomagnesaemia (risk of digitalis toxicity) · hypoxia (risk of digitalis toxicity) · recent myocardial infarction · severe respiratory disease · sick sinus syndrome · thyroid disease

● **INTERACTIONS** → Appendix 1: digoxin

● **SIDE-EFFECTS**

- **Common or very common** Arrhythmias · cardiac conduction disorder · cerebral impairment · diarrhoea · dizziness · eosinophilia · nausea · skin reactions · vision disorders · vomiting
- **Uncommon** Depression
- **Rare or very rare** Appetite decreased · asthenia · confusion · gastrointestinal disorders · gynaecomastia · headache · malaise · psychosis · thrombocytopenia

Overdose If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

● **PREGNANCY**
Dose adjustments May need dosage adjustment.

● **BREAST FEEDING** Amount too small to be harmful.

● **RENAL IMPAIRMENT**
Dose adjustments Expert sources advise use half normal dose if estimated glomerular filtration rate is 10–50 mL/minute/1.73 m^2 and use a quarter normal dose if estimated glomerular filtration rate is less than 10 mL/minute/1.73 m^2. See p. 15.

● **MONITORING REQUIREMENTS**

- For plasma-digoxin concentration assay, blood should be taken at least 6 hours after a dose.
- Plasma-digoxin concentration should be maintained in the range 0.8–2 micrograms/litre.
- Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For *intravenous infusion*, dilute with Sodium Chloride 0.9% or Glucose 5% to a max. concentration of 62.5 micrograms/mL; loading doses should be given over 30–60 minutes and maintenance dose over 10–20 minutes.
- With oral use For *oral* administration, oral solution must **not** be diluted.

● **PATIENT AND CARER ADVICE** Patient counselling is advised for digoxin elixir (use pipette).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

- **Digoxin (Non-proprietary)**
  Digoxin 62.5 microgram Digoxin 62.5microgram tablets | 28 tablet PoM £1.68 DT = £1.27
  Digoxin 125 microgram Digoxin 125microgram tablets | 28 tablet PoM £1.71 DT = £1.26

2 Bleeding disorders

ANTIHAEMORRHAGICS › ANTIFIBRINOLYTICS

Tranexamic acid

25-Jan-2022

- **DRUG ACTION** Tranexamic acid is an antifibrinolytic that prevents or reduces bleeding by impairing fibrin dissolution.

- **INDICATIONS AND DOSE**

Inhibition of fibrinolysis

- BY MOUTH
- Child: 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g)
- BY SLOW INTRAVENOUS INJECTION
- Child: 10 mg/kg 2–3 times a day (max. per dose 1 g), dose to be given over at least 10 minutes
- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: 45 mg/kg, dose to be given over 24 hours

Menorrhagia

- BY MOUTH
- Child 12–17 years: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

Hereditary angioedema

- BY MOUTH
- Child: 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g), for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards
- BY SLOW INTRAVENOUS INJECTION
- Child: 10 mg/kg 2–3 times a day (max. per dose 1 g), dose to be given over at least 10 minutes
- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: 45 mg/kg, dose to be given over 24 hours

Prevention of excessive bleeding after dental procedures (e.g. in haemophilia)

- BY INTRAVENOUS INJECTION
- Child 6–17 years: 10 mg/kg (max. per dose 1.5 g), dose to be given pre-operatively
- BY MOUTH
- Child 6–17 years: 15–25 mg/kg (max. per dose 1.5 g), dose to be given pre-operatively, then 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g) for up to 8 days, dose to be given postoperatively

Prevention of excessive bleeding after dental procedures (e.g. in haemophilia) with mouthwash 5% solution (specialist use only)

- BY MOUTH
- Child 6–17 years: 5–10 mL 4 times a day for 2 days, rinse mouth with solution; the solution should not be swallowed

Reduction of blood loss during cardiac surgery

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for reduction of blood loss during cardiac surgery; injection not licensed for use in children under 1 year or for administration by intravenous infusion.
- **CONTRA-INDICATIONS** Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) · history of convulsions · thromboembolic disease
- **CAUTIONS** Irregular menstrual bleeding (establish cause before initiating therapy) · massive haematuria (avoid if risk of ureteric obstruction) · patients receiving oral contraceptives (increased risk of thrombosis)

CAUTIONS, FURTHER INFORMATION

- Menorrhagia Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.

- **INTERACTIONS** → Appendix 1: tranexamic acid
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Diarrhoea (reduce dose) · nausea · vomiting
- **Uncommon** Allergic dermatitis
- **Rare or very rare** Colour vision change (discontinue) · embolism and thrombosis
- **Frequency not known** Seizure (more common at high doses) · visual impairment (discontinue)

SPECIFIC SIDE-EFFECTS

- With intravenous use Hypotension · malaise (on rapid intravenous injection)

- **PREGNANCY** No evidence of teratogenicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Small amount present in milk—antifibrinolytic effect in infant unlikely.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose in mild to moderate impairment.
- **MONITORING REQUIREMENTS** Regular liver function tests in long-term treatment of hereditary angioedema.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous administration*, manufacturer advises dilute with Glucose 5% *or* Sodium chloride 0.9%.
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Tranexamic acid for the treatment or prevention of bleeding in haemophilia and other clotting problems www.medicinesforchildren.org.uk/medicines/tranexamic-acid-for-the-treatment-or-prevention-of-bleeding-in-haemophilia-and-other-clotting-problems/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Tranexamic acid (Non-proprietary)**
Tranexamic acid 500 mg Tranexamic acid 500mg tablets | 60 tablet PoM £35.43 DT = £6.01
- **Cyklokapron** (Viatris UK Healthcare Ltd)
Tranexamic acid 500 mg Cyklokapron 500mg tablets | 60 tablet PoM £14.30 DT = £6.01

Solution for injection

- **Tranexamic acid (Non-proprietary)**
Tranexamic acid 100 mg per 1 ml Tranexamic acid 500mg/5ml solution for injection ampoules | 5 ampoule PoM £7.50 DT = £7.50 (Hospital only) | 10 ampoule PoM £14.30-£15.47 DT = £15.47 (Hospital only)
Tranexamic acid 1g/10ml solution for injection ampoules | 5 ampoule PoM £15.00 (Hospital only)
- **Cyklokapron** (Pfizer Ltd)
Tranexamic acid 100 mg per 1 ml Cyklokapron 500mg/5ml solution for injection ampoules | 10 ampoule PoM £15.47 DT = £15.47 (Hospital only)

ANTIHAEMORRHAGICS › HAEMOSTATICS

Emicizumab

09-May-2018

- **DRUG ACTION** Emicizumab is a monoclonal antibody that bridges activated factor IX and factor X to restore function of missing activated factor VIII, which is needed for haemostasis.

- **INDICATIONS AND DOSE**

Prophylaxis of haemorrhage in haemophilia A (initiated by a specialist)

- BY SUBCUTANEOUS INJECTION
- Child: Initially 3 mg/kg once weekly for 4 weeks, then maintenance 1.5 mg/kg once weekly, alternatively maintenance 3 mg/kg every 2 weeks, alternatively maintenance 6 mg/kg every 4 weeks

- **CAUTIONS** Children under 1 year · concomitant bypassing agent · risk factors for thrombotic microangiopathy

CAUTIONS, FURTHER INFORMATION

- Concomitant bypassing agent Manufacturer advises discontinue bypassing agents the day before starting emicizumab; if a bypassing agent is required—consult product literature.

- **SIDE-EFFECTS**
- **Common or very common** Arthralgia · diarrhoea · fever · headache · myalgia
- **Uncommon** Cavernous sinus thrombosis · embolism and thrombosis · skin necrosis · thrombotic microangiopathy

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **EFFECT ON LABORATORY TESTS** Manufacturer advises to avoid intrinsic pathway clotting-based laboratory tests or use with caution as results may be misinterpreted—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises max. 2 mL per injection site; rotate injection site and avoid skin that is tender, damaged or scarred. Patients or their caregivers may self-administer *Hemlibra*® after appropriate training.
- **PRESCRIBING AND DISPENSING INFORMATION** Emicizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is missed, the missed dose may be taken up to a day before the next scheduled dose. The next dose should then be taken on the usual scheduled dosing day.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Hemlibra** (Roche Products Ltd) ▼
  Emicizumab 30 mg per 1 ml Hemlibra 30mg/1ml solution for injection vials | 1 vial PoM £2,415.30 (Hospital only)
  Emicizumab 150 mg per 1 ml Hemlibra 150mg/1ml solution for injection vials | 1 vial PoM £12,076.50 (Hospital only)
  Hemlibra 105mg/0.7ml solution for injection vials | 1 vial PoM £8,453.55 (Hospital only)
  Hemlibra 60mg/0.4ml solution for injection vials | 1 vial PoM £4,830.60 (Hospital only)

2.1 Coagulation factor deficiencies

BLOOD AND RELATED PRODUCTS › COAGULATION PROTEINS

Dried prothrombin complex

20-Nov-2020

(Human prothrombin complex)

- **INDICATIONS AND DOSE**

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available | Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

- BY INTRAVENOUS INFUSION
- Child: (consult haematologist)

- **CONTRA-INDICATIONS** History of heparin induced thrombocytopenia · myocardial infarction within the last 3 months (no information available) · unstable angina within the last 3 months (no information available)
- **CAUTIONS** Disseminated intravascular coagulation · history of myocardial infarction or coronary heart disease · postoperative use · risk of thrombosis · vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
- **Common or very common** Embolism and thrombosis
- **Uncommon** Anxiety · device thrombosis · haemorrhage · hepatic function abnormal · hypertension · respiratory disorders
- **Frequency not known** Cardiac arrest · chills · circulatory collapse · disseminated intravascular coagulation · dyspnoea · heparin-induced thrombocytopenia · hypotension · nausea · skin reactions · tachycardia · tremor
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of thromboembolic complications).
  Monitoring Monitor closely in hepatic impairment (risk of thromboembolic complications).
- **PRESCRIBING AND DISPENSING INFORMATION** Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **Beriplex P/N** (CSL Behring UK Ltd)
  Factor VII 175 unit, Protein S 195 unit, Factor IX 255 unit, Protein C 300 unit, Factor II 340 unit, Factor X 410 unit Beriplex P/N 250 powder and solvent for solution for injection vials | 1 vial PoM £150.00 (Hospital only)
  Factor VII 350 unit, Protein S 390 unit, Factor IX 510 unit, Protein C 600 unit, Factor II 680 unit, Factor X 820 unit Beriplex P/N 500 powder and solvent for solution for injection vials | 1 vial PoM £300.00 (Hospital only)
  Factor VII 700 unit, Protein S 1000 unit, Factor IX 1020 unit, Protein C 1200 unit, Factor II 1360 unit, Factor X 1640 unit Beriplex P/N 1,000 powder and solvent for solution for injection vials | 1 vial PoM £600.00 (Hospital only)
- **Prothromplex Total** (Takeda UK Ltd)
  Factor VII 500 unit, Factor II 600 unit, Factor IX 600 unit, Factor X 600 unit Prothromplex Total 600 powder and solvent for solution for injection vials | 1 vial PoM £306.00 (Hospital only)

Powder and solvent for solution for infusion

- **Octaplex** (Octapharma Ltd)
  Octaplex 1,000unit powder and solvent for solution for infusion vials | 1 vial PoM £416.50 (Hospital only)

Factor VII 330 unit, Protein C 380 unit, Protein S 390 unit, Factor X 480 unit, Factor II 490 unit, Factor IX 500 unit Octaplex 500unit powder and solvent for solution for infusion vials | 1 vial PoM £245.00 (Hospital only)

Factor VIIa (recombinant)

30-Jan-2020

(Eptacog alfa (activated))

● **INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann's thrombasthenia

- BY INTRAVENOUS INJECTION
- Child: (consult haematologist)

● **CAUTIONS** Disseminated intravascular coagulation · risk of thrombosis

● **SIDE-EFFECTS**

- **Uncommon** Embolism and thrombosis · fever · hepatic disorders · intestinal ischaemia · skin reactions
- **Rare or very rare** Angina pectoris · cerebrovascular insufficiency · coagulation disorders · headache · myocardial infarction · nausea · peripheral ischaemia
- **Frequency not known** Angioedema · flushing · flushing · haemorrhage · headache · infusion related reaction · nausea · skin reactions · thrombophlebitis · vomiting
- **Uncommon** Arthropathy · dizziness · fatigue · feeling hot · hyperaemia · hypersensitivity · hypertension · insomnia · lymphoedema · musculoskeletal stiffness · myocardial infarction · pain · peripheral oedema · sinus tachycardia

● **MONITORING REQUIREMENTS** Monitor for development of factor VIII inhibitors.

● **PRESCRIBING AND DISPENSING INFORMATION** The available preparations may not be licensed for all indications or all age-groups—further information can be found in the product literature.

Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor. *Fanhdi*®, *Haemoctin*®, *Octanate*®, and *Optivate*® are not indicated for use in von Willebrand's disease.

Recombinant human coagulation factor VIII, including efmoroctocog alfa, moroctocog alfa, octocog alfa, rurioctocog alfa pegol, simoctocog alfa, turoctocog alfa, and turoctocog alfa pegol, does not contain von Willebrand factor and is not indicated for use in von Willebrand's disease.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **NovoSeven** (Novo Nordisk Ltd)

Eptacog alfa activated 50000 unit NovoSeven 1mg (50,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £525.20 (Hospital only)
NovoSeven 1mg (50,000units) powder and solvent for solution for injection vials | 1 vial PoM £525.20 (Hospital only)

Eptacog alfa activated 100000 unit NovoSeven 2mg (100,000units) powder and solvent for solution for injection vials | 1 vial PoM £1,050.40 (Hospital only)
NovoSeven 2mg (100,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £1,050.40 (Hospital only)

Eptacog alfa activated 250000 unit NovoSeven 5mg (250,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £2,626.00 (Hospital only)
NovoSeven 5mg (250,000units) powder and solvent for solution for injection vials | 1 vial PoM £2,626.00 (Hospital only)

Eptacog alfa activated 400000 unit NovoSeven 8mg (400,000units) powder and solvent for solution for injection vials | 1 vial PoM £4,201.60 (Hospital only)
NovoSeven 8mg (400,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £4,201.60 (Hospital only)

Factor VIII fraction, dried

13-Jan-2021

(Human coagulation factor VIII, dried)

● **INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency | Von Willebrand's disease

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Child: (consult haematologist)

● **CAUTIONS** Risk of intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB (in products containing isoagglutinins) · vaccination against hepatitis A and hepatitis B may be required (consult product literature)

● **SIDE-EFFECTS**

- **Common or very common** Anamnestic reaction · cough · device thrombosis · diarrhoea · factor VIII inhibition · fever

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Factor IX fraction, dried

30-Jan-2020

- **INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

- BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Child: (consult haematologist)

- **CONTRA-INDICATIONS** Disseminated intravascular coagulation
- **CAUTIONS** Risk of thrombosis—principally with low purity products · vaccination against hepatitis A and hepatitis B may be required (consult product literature)
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · back pain · dyspnoea · hypersensitivity · nausea · sensation abnormal · skin reactions · vasodilation
  - **Rare or very rare** Angioedema · cardiac discomfort · chills · disseminated intravascular coagulation · embolism and thrombosis · headache · hypotension · lethargy · myocardial infarction · tachycardia · vomiting · wheezing
  - **Frequency not known** Nephrotic syndrome
- **PRESCRIBING AND DISPENSING INFORMATION** Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **Haemonine** (Biotest (UK) Ltd)
  Factor IX high purity 500 unit Haemonine 500unit powder and solvent for solution for injection vials | 1 vial PoM £300.00 (Hospital only)

Factor IX high purity 1000 unit Haemonine 1,000unit powder and solvent for solution for injection vials | 1 vial PoM £600.00 (Hospital only)

- **Replenine-VF** (Bio Products Laboratory Ltd)

Factor IX high purity 500 unit Replenine-VF 500unit powder and solvent for solution for injection vials | 1 vial PoM £265.00 (Hospital only)

Factor IX high purity 1000 unit Replenine-VF 1,000unit powder and solvent for solution for injection vials | 1 vial PoM £530.00 (Hospital only)

Powder and solvent for solution for infusion

- **BeneFIX** (Pfizer Ltd)

Nonacog alfa 250 unit BeneFIX 250unit powder and solvent for solution for infusion vials | 1 vial PoM £151.80 (Hospital only)

Nonacog alfa 500 unit BeneFIX 500unit powder and solvent for solution for infusion vials | 1 vial PoM £303.60 (Hospital only)

Nonacog alfa 1000 unit BeneFIX 1,000unit powder and solvent for solution for infusion vials | 1 vial PoM £607.20 (Hospital only)

Nonacog alfa 2000 unit BeneFIX 2,000unit powder and solvent for solution for infusion vials | 1 vial PoM £1,214.40 (Hospital only)

Nonacog alfa 3000 unit BeneFIX 3,000unit powder and solvent for solution for infusion vials | 1 vial PoM £1,821.60 (Hospital only)

Factor XIII fraction, dried

30-Jan-2020

(Human fibrin-stabilising factor, dried)

- **INDICATIONS AND DOSE**

Congenital factor XIII deficiency

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult haematologist)

- **CAUTIONS** Vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
- **Rare or very rare** Anaphylactoid reaction · dyspnoea · skin reactions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **Fibrogammin P** (CSL Behring UK Ltd)

Factor XIII 250 unit Fibrogammin 250unit powder and solvent for solution for injection vials | 1 vial PoM £106.58

Factor XIII 1250 unit Fibrogammin 1,250unit powder and solvent for solution for injection vials | 1 vial PoM £532.90

Fibrinogen, dried

10-May-2022

(Human fibrinogen)

- **INDICATIONS AND DOSE**

Haemorrhage in hypofibrinogenaemia or afibrinogenaemia

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult haematologist)

- **CAUTIONS** Risk of thrombosis · vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
- **Common or very common** Chills · cough · headache · hypersensitivity · pallor · skin reactions · vomiting
- **Uncommon** Asthma · dizziness · embolism and thrombosis · feeling hot · night sweats · tinnitus
- **PREGNANCY** Manufacturer advises not known to be harmful—no information available.
- **BREAST FEEDING** Specialist sources indicate suitable for use—unlikely to be excreted into milk and not absorbed from the infant's gastro-intestinal tract.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrinogen is prepared from human plasma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Riastap** (CSL Behring UK Ltd)

Human fibrinogen 1 gram Riastap 1g powder for solution for infusion vials | 1 vial PoM £400.00 (Hospital only)

Powder and solvent for solution for infusion

ELECTROLYTES: May contain Sodium

- **FibCLOT** (LFB Biopharmaceuticals Ltd)

Human fibrinogen 1.5 gram FibCLOT 1.5g powder and solvent for solution for infusion vials | 1 vial PoM £600.00 (Hospital only)

- **Fibryga** (Octapharma Ltd) ▼

Human fibrinogen 1 gram Fibryga 1g powder and solvent for solution for infusion bottles | 1 bottle PoM £400.00 (Hospital only)

Protein C concentrate

30-Jan-2020

- **INDICATIONS AND DOSE**

Congenital protein C deficiency

- BY INTRAVENOUS INJECTION
- Child: (consult haematologist)

- **CAUTIONS** Hypersensitivity to heparins · vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
- **Rare or very rare** Dizziness · fever · skin reactions
- **Frequency not known** Haemothorax · hyperhidrosis · restlessness
- **PRESCRIBING AND DISPENSING INFORMATION** Protein C is prepared from human plasma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **Ceprotin** (Takeda UK Ltd)

Protein C 500 unit Ceprotin 500unit powder and solvent for solution for injection vials | 1 vial PoM £1,000.00

Protein C 1000 unit Ceprotin 1000unit powder and solvent for solution for injection vials | 1 vial PoM £2,000.00

Von Willebrand factor

03-Mar-2021

- **INDICATIONS AND DOSE**

von Willebrand disease

- BY SLOW INTRAVENOUS INJECTION
- Child: (consult haematologist)

- **CAUTIONS** Vaccination against hepatitis A and hepatitis B may be required in patients receiving human plasma-derived von Willebrand factor
- **SIDE-EFFECTS**
- **Uncommon** Angioedema · chest tightness · chills · flushing · headache · hypotension · lethargy · nausea · paraesthesia · restlessness · tachycardia · urticaria generalised · vomiting · wheezing
- **Rare or very rare** Fever
- **Frequency not known** Thromboembolism
- **PREGNANCY** EvGr Use only if potential benefit outweighs risk—no information available. M
- **BREAST FEEDING** Specialist sources indicate use with caution—no information available. Low amounts expected in milk and absorption in infants unlikely.
- **MONITORING REQUIREMENTS**
- EvGr Monitor for development of von Willebrand factor neutralising antibodies—consider alternative treatment options if present at high levels.
- Monitor for signs of thrombosis in patients with risk factors—initiate thromboprophylaxis as appropriate. M
- **PRESCRIBING AND DISPENSING INFORMATION** Licensed age groups differ between preparations—further information

can be found in the product literature for the individual preparations.

EvGr Record the brand name and batch number after each administration. Ⓜ

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

BLOOD AND RELATED PRODUCTS › HAEMOSTATIC PRODUCTS

Factor VIII inhibitor bypassing fraction

30-Jan-2020

- **INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors | Treatment of haemorrhage in non-haemophiliac patients with acquired factor VIII inhibitors

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Child: (consult haematologist)

- **CONTRA-INDICATIONS** Disseminated intravascular coagulation
- **CAUTIONS** Risk of thrombosis · vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
- **Common or very common** Dizziness · headache · hypersensitivity · hypotension · skin reactions
- **Frequency not known** Abdominal discomfort · anamnestic reaction · angioedema · chest discomfort · chills · cough · diarrhoea · disseminated intravascular coagulation · drowsiness · dyspnoea · embolism and thrombosis · fever · flushing · hypertension · ischaemic stroke · malaise · myocardial infarction · nausea · paraesthesia · respiratory disorders · restlessness · tachycardia · taste altered · vomiting
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

- **FEIBA Imuno** (Takeda UK Ltd)
  Factor VIII inhibitor bypassing fraction 500 unit FEIBA 50units/ml (500unit) powder and 10ml solvent for solution for infusion vials | 1 vial PoM £390.00 (Hospital only)
  FEIBA 25units/ml (500unit) powder and 20ml solvent for solution for infusion vials | 1 vial PoM £390.00 (Hospital only)
  Factor VIII inhibitor bypassing fraction 1000 unit FEIBA 50units/ml (1,000unit) powder and 20ml solvent for solution for infusion vials | 1 vial PoM £780.00 (Hospital only)
  Factor VIII inhibitor bypassing fraction 2500 unit FEIBA 50units/ml (2,500unit) powder and 50ml solvent for solution for infusion vials | 1 vial PoM £1,950.00 (Hospital only)

BLOOD AND RELATED PRODUCTS › PLASMA PRODUCTS

Fresh frozen plasma

13-Jan-2021

- **INDICATIONS AND DOSE**

Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced

- BY INTRAVENOUS INFUSION
- Child: (consult haematologist)

- **CONTRA-INDICATIONS** Avoid use as a volume expander · IgA deficiency with confirmed antibodies to IgA
- **CAUTIONS** Cardiac decompensation · pulmonary oedema · risk of thrombosis · severe protein S deficiency (avoid products with low protein S activity e.g. *OctaplasLG*®) · vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
- **Common or very common** Skin reactions
- **Uncommon** Fever · hypersensitivity · hypoxia · nausea · sensation abnormal · vomiting
- **Rare or very rare** Abdominal pain · anxiety · arrhythmias · back pain · cardiac arrest · chest discomfort · chills · circulatory collapse · citrate toxicity · dizziness · dyspnoea · flushing · haemolytic anaemia · haemorrhage · hyperhidrosis · hypertension · hypotension · localised oedema · malaise · procedural complications · pulmonary oedema · respiratory disorders · thromboembolism
- **PRESCRIBING AND DISPENSING INFORMATION** Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.

A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (*OctaplasLG*®).

Children under 16 years should only receive virucidally inactivated preparations of fresh frozen plasma, sourced from 'low prevalence BSE regions' such as the USA.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Infusion

- **OctaplasLG** (Octapharma Ltd)
  Human plasma proteins 57.5 mg per 1 ml OctaplasLG Blood Group A infusion 200ml bags | 1 bag PoM £75.00 (Hospital only)
  OctaplasLG Blood Group B infusion 200ml bags | 1 bag PoM £75.00 (Hospital only)
  OctaplasLG Blood Group AB infusion 200ml bags | 1 bag PoM £75.00 (Hospital only)
  OctaplasLG Blood Group O infusion 200ml bags | 1 bag PoM £75.00 (Hospital only)

2.2 Subarachnoid haemorrhage

CALCIUM-CHANNEL BLOCKERS

F 120

Nimodipine

01-Dec-2021

- **DRUG ACTION** Nimodipine is a dihydropyridine calcium-channel blocker.

- **INDICATIONS AND DOSE**

Treatment of vasospasm following subarachnoid haemorrhage (specialist use only)

- BY INTRAVENOUS INFUSION
- Child 1 month-11 years: Initially 15 micrograms/kg/hour (max. per dose 500 micrograms/hour), increased after 2 hours if no severe decrease in blood pressure; increased to 30 micrograms/kg/hour (max. per dose 2 mg/hour), continue for at least 5 days

continued →

(max. 14 days), use initial dose of 7.5 micrograms/kg/hour if blood pressure unstable
- Child 12–17 years (body-weight up to 70 kg): Initially 0.5 mg/hour, increased after 2 hours if no severe decrease in blood pressure; increased to 1–2 mg/hour, continue for at least 5 days (max. 14 days)
- Child 12–17 years (body-weight 70 kg and above): Initially up to 1 mg/hour, use dose if blood pressure stable; increased after 2 hours if no severe decrease in blood pressure; increased to 1–2 mg/hour, continue for at least 5 days (max. 14 days)

Prevention of vasospasm following subarachnoid haemorrhage
- BY MOUTH
- Child: 0.9–1.2 mg/kg 6 times a day (max. per dose 60 mg), started within 4 days of haemorrhage and continued for 21 days

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION
SAFE PRACTICE
Nimodipine has been confused with amlodipine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS** Cerebral oedema · hypotension · severely raised intracranial pressure
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
- **Uncommon** Thrombocytopenia · vasodilation
- **Rare or very rare** Bradycardia · ileus
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT**
- With oral use Manufacturer advises consider avoiding in severe impairment.
  Dose adjustments · With oral use In adults, manufacturer advises dose reduction—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** EvGr Avoid concomitant administration of nimodipine infusion and tablets. Ⓜ
- With oral use For administration *by mouth*, expert sources advise tablets may be crushed but are light sensitive.
- With intravenous use EvGr For *continuous intravenous infusion*, administer undiluted via an infusion pump and three-way stopcock on a central venous catheter connected to a running infusion of Glucose 5%, or Sodium Chloride 0.9% (consult product literature); not to be added to an infusion container; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light. Ⓜ Polyethylene, polypropylene, or glass apparatus should be used.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Solution for infusion
- **Nimotop** (Bayer Plc)
  Nimodipine 200 microgram per 1 ml Nimotop 0.02% solution for infusion 50ml vials | 1 vial PoM £13.60 (Hospital only)

Tablet
- **Nimotop** (Bayer Plc)
  Nimodipine 30 mg Nimotop 30mg tablets | 100 tablet PoM £40.00 DT = £40.00

3 Blood clots

3.1 Blocked catheters and lines

Other drugs used for Blocked catheters and lines Heparin (unfractionated), p. 105 · Urokinase, p. 95

ANTITHROMBOTIC DRUGS › TISSUE PLASMINOGEN ACTIVATORS

Fibrinolytic drugs

Overview

Alteplase p. 95, streptokinase p. 95 and urokinase p. 95 are used in children to dissolve intravascular thrombi and unblock occluded arteriovenous shunts, catheters, and indwelling central lines blocked with fibrin clots. Treatment should be started as soon as possible after a clot has formed and discontinued once a pulse in the affected limb is detected, or the shunt or catheter unblocked.

The safety and efficacy of treatment remains uncertain, especially in neonates. A fibrinolytic drug is probably only appropriate where arterial occlusion threatens ischaemic damage; an anticoagulant may stop the clot getting bigger. Alteplase is the preferred fibrinolytic in children and neonates; there is less risk of adverse effects including allergic reactions.

Fibrinolytics

- **DRUG ACTION** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.
- **CONTRA-INDICATIONS** Acute pancreatitis · aneurysm · aortic dissection · arteriovenous malformation · bacterial endocarditis · bleeding diatheses · coagulation defects · coma · history of cerebrovascular disease (especially recent events or with any residual disability) · neoplasm with risk of haemorrhage · oesophageal varices · pericarditis · recent gastro-intestinal ulceration · recent haemorrhage · recent surgery (including dental extraction) · recent trauma · severe hypertension
- **CAUTIONS** Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation) · external chest compression · hypertension · risk of bleeding (including that from venepuncture or invasive procedures)
- **SIDE-EFFECTS**
- **Common or very common** Anaphylactic reaction · angina pectoris · cardiac arrest · cardiogenic shock · chills · CNS haemorrhage · ecchymosis · fever · haemorrhage · haemorrhagic stroke · heart failure · hypotension · ischaemia recurrent (when used in myocardial infarction) · nausea · pericarditis · pulmonary oedema · vomiting
- **Uncommon** Aphasia · mitral valve incompetence · myocardial rupture · pericardial disorders · reperfusion arrhythmia (when used in myocardial infarction) · seizure

  SIDE-EFFECTS, FURTHER INFORMATION Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs.
- **PREGNANCY** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a

theoretical risk of fetal haemorrhage throughout pregnancy.

- **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe impairment.

94

Alteplase

20-Nov-2020

(rt-PA; Tissue-type plasminogen activator)

- **INDICATIONS AND DOSE**

Intravascular thrombosis

- BY INTRAVENOUS INFUSION
- Neonate: 100–500 micrograms/kg/hour for 3–6 hours, use ultrasound assessment to monitor effect before considering a second course of treatment (consult local protocol).
- Child: 100–500 micrograms/kg/hour for 3–6 hours, use ultrasound assessment to monitor effect before considering a second course of treatment; maximum 100 mg per day

ACTILYSE CATHFLO ®

Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)

- BY INTRAVENOUS INJECTION
- Child: (consult product literature)

- **UNLICENSED USE** *Actilyse*® not licensed for use in children.
- **CONTRA-INDICATIONS** Recent delivery
- **INTERACTIONS** → Appendix 1: alteplase
- **SIDE-EFFECTS**
- **Uncommon** Haemothorax
- **Rare or very rare** Agitation · confusion · delirium · depression · epilepsy · psychosis · speech disorder
- **Frequency not known** Brain oedema (caused by reperfusion)
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process). M
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Actilyse*®), manufacturer advises dissolve in Water for Injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute further in Sodium Chloride 0.9% to a concentration of not less than 200 micrograms/mL; not to be diluted in Glucose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection

- **Actilyse** (Boehringer Ingelheim Ltd)
  Alteplase 10 mg Actilyse 10mg powder and solvent for solution for injection vials | 1 vial PoM £172.80
  Alteplase 20 mg Actilyse 20mg powder and solvent for solution for injection vials | 1 vial PoM £259.20

Powder and solvent for solution for infusion

- **Actilyse** (Boehringer Ingelheim Ltd)
  Alteplase 50 mg Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial PoM £432.00

94

Streptokinase

13-Apr-2021

- **INDICATIONS AND DOSE**

Intravascular thrombosis

- INITIALLY BY INTRAVENOUS INFUSION
- Child 1 month-11 years: Initially 2500–4000 units/kg, dose to be given over 30 minutes, followed by (by continuous intravenous infusion) 500–1000 units/kg/hour for up to 3 days until reperfusion occurs
- Child 12-17 years: Initially 250 000 units, dose to be given over 30 minutes, followed by (by continuous intravenous infusion) 100 000 units/hour for up to 3 days until reperfusion occurs

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Cavernous pulmonary disease · recent streptococcal infections
- **INTERACTIONS** → Appendix 1: streptokinase
- **SIDE-EFFECTS**
- **Common or very common** Arrhythmias · asthenia · diarrhoea · epigastric pain · headache · malaise · pain
- **Uncommon** Respiratory arrest · splenic rupture
- **Rare or very rare** Arthritis · eye inflammation · hypersensitivity · nephritis · nerve disorders · neurological effects · pulmonary oedema non-cardiogenic (caused by reperfusion) · shock · vasculitis
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, manufacturer advises reconstitute with Sodium Chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution. Expert sources advise monitor fibrinogen concentration closely; if fibrinogen concentration less than 1 g/litre, stop streptokinase infusion and start unfractionated heparin; restart streptokinase once fibrinogen concentration reaches 1 g/litre.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Streptokinase (Non-proprietary)**
  Streptokinase 1.5 mega unit Streptokinase 1.5million unit powder for solution for infusion vials | 1 vial PoM £195.00 (Hospital only) | 1 vial PoM £195.00
  Streptokinase 250000 unit Streptokinase 250,000unit powder for solution for infusion vials | 1 vial PoM £97.50 (Hospital only)

94

Urokinase

04-Jan-2022

- **INDICATIONS AND DOSE**

Occluded arteriovenous shunts, catheters, and indwelling central lines

- TO THE DEVICE AS A FLUSH
- Neonate: 5000–25 000 units, instil directly into occluded catheter or central line **only**, dilute dose in sodium chloride 0.9% to fill catheter dead space. Leave for 20–60 minutes then aspirate the lysate and flush with sodium chloride 0.9%.
- Child: 5000–25 000 units, instil directly into occluded catheter or central line **only**, dilute dose in sodium chloride 0.9% to fill catheter dead space. Leave for 20–60 minutes then aspirate the lysate and flush with sodium chloride 0.9%

3.2 Thromboembolism

Venous thromboembolism

18-Jan-2022

Venous thromboembolism prophylaxis

For guidance on reducing the risk of venous thromboembolism (VTE) in children with COVID-19, see NICE rapid guideline: **Managing COVID-19** (available at: www.nice.org.uk/guidance/ng191), and SIGN rapid guideline: **Prevention and management of venous thromboembolism in patients with COVID-19** (available at: www.sign.ac.uk/our-guidelines/prevention-and-management-of-venous-thromboembolism-in-covid-19/). For further information on COVID-19, see COVID-19 p. 456.

Low-dose heparin (unfractionated) p. 105 by subcutaneous injection is used to prevent thrombotic episodes in 'high-risk' patients; laboratory monitoring of APTT or anti-Factor Xa concentration is also required in prophylactic regimens in children. Low molecular weight heparins, aspirin (antiplatelet dose) p. 99, and warfarin sodium p. 109 can also be used for prophylaxis.

The following guidance on reducing the risk of VTE applies to children aged over 16 years and is based on the NICE guideline: **Venous thromboembolism in over 16s** (see *Useful resources*).

EvGr All children over 16 years old should undergo a risk assessment to identify their risk of VTE and bleeding on admission to hospital. A Commonly used risk assessment tools can be found at: www.nice.org.uk/guidance/ng89/resources. Children over 16 years old considered to be at high risk of VTE include those who are anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of VTE and thrombophilic disorder. Pregnancy and the postpartum period are also risk factors for VTE.

There are two methods of thromboprophylaxis: mechanical and pharmacological. Options for mechanical prophylaxis are anti-embolism stockings that provide graduated compression and produce a calf pressure of 14–15 mmHg, and intermittent pneumatic compression. EvGr Anti-embolism stockings should be worn day and night until the child is sufficiently mobile; they should not be offered to children over 16 years old admitted with conditions such as severe leg oedema, or local conditions (e.g. gangrene, dermatitis).

When using pharmacological prophylaxis, in most cases, it should start as soon as possible or within 14 hours of admission. Children over 16 years of age with risk factors for bleeding (e.g. thrombocytopenia, acquired or untreated inherited bleeding disorders) should *only* receive pharmacological prophylaxis when their risk of VTE outweighs their risk of bleeding. Children over 16 years of age receiving anticoagulant treatment who are at high risk of VTE should be considered for prophylaxis if their anticoagulant treatment is interrupted, for example during the peri-operative period. A

Surgical patients

EvGr To reduce the risk of VTE in surgical patients over 16 years old, regional anaesthesia over general anaesthesia should be used if possible.

Mechanical prophylaxis (e.g. anti-embolism stockings or intermittent pneumatic compression) should be offered to children over 16 years old with major trauma, or undergoing cranial, abdominal, bariatric, thoracic, maxillofacial, ear, nose, and throat, cardiac or elective spinal surgery. Prophylaxis should continue until the child is sufficiently mobile or discharged from hospital (or for 30 days in spinal injury, elective spinal surgery or cranial surgery). A Choice of mechanical prophylaxis depends on factors such as the type of surgery, suitability for the child, and their condition.

EvGr Pharmacological prophylaxis should be considered in children over 16 years old undergoing general or orthopaedic surgery when the risk of VTE outweighs the risk of bleeding. A The choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy. EvGr A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) is preferred in patients with renal impairment. Fondaparinux sodium [unlicensed] is an option for children over 16 years old undergoing abdominal, bariatric, thoracic or cardiac surgery, or for patients with lower limb immobilisation or fragility fractures of the pelvis, hip or proximal femur.

Pharmacological prophylaxis in general surgery should usually continue for at least 7 days post-surgery, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen, and to 30 days in spinal surgery.

Mechanical prophylaxis with intermittent pneumatic compression should be considered when pharmacological prophylaxis is contra-indicated in children over 16 years old undergoing lower limb amputation, or those with major trauma or fragility fractures of the pelvis, hip or proximal femur. A

Medical patients

The choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. EvGr Acutely ill medical patients over 16 years old who are at high risk of VTE should be offered pharmacological prophylaxis. Children over 16 years old should be given either a low molecular weight heparin as a first-line option, or fondaparinux sodium [unlicensed] as an alternative, for a minimum of 7 days. Children over 16 years old with renal impairment should be given either a low molecular weight heparin or heparin (unfractionated) and the dose should be adjusted as necessary.

Mechanical prophylaxis can be considered when pharmacological prophylaxis is contra-indicated; their use should be continued until the child is sufficiently mobile. A

Thromboprophylaxis in pregnancy

EvGr All pregnant young women over 16 years old (who are not in active labour), or young women over 16 years old who have given birth, had a miscarriage or termination of pregnancy during the past 6 weeks, with a risk of VTE that outweighs the risk of bleeding should be considered for pharmacological prophylaxis with a low molecular weight heparin during hospital admission. In pregnant young women over 16 years old, prophylaxis should be continued until there is no longer a risk of VTE, or until discharge from hospital. Young women over 16 years old who have given birth, had a miscarriage or termination of pregnancy during the past 6 weeks, should start thromboprophylaxis with a low molecular weight heparin 4–8 hours after the event,

unless contra-indicated, and continue for a minimum of 7 days.

Additional mechanical prophylaxis should be considered for young women over 16 years old who are likely to be immobilised or have significantly reduced mobility and continued until the young woman is sufficiently mobile or discharged from hospital. Intermittent pneumatic compression should be used as the first-line option and anti-embolism stockings as an alternative. Ⓐ

Venous thromboembolism treatment

For guidance on the management of venous thromboembolism in children aged 16 years and over with COVID-19, see SIGN rapid guideline: **Prevention and management of venous thromboembolism in patients with COVID-19** (available at: www.sign.ac.uk/our-guidelines/prevention-and-management-of-venous-thromboembolism-in-covid-19/). For further information on COVID-19, see COVID-19 p. 456.

For the initial treatment of thrombotic episodes heparin (unfractionated) p. 105 is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or by intermittent subcutaneous injection; the use of intermittent intravenous injection is no longer recommended. Alternatively, a low molecular weight heparin may be given for initial treatment. If oral anticoagulation with warfarin sodium p. 109 [unlicensed] is also required, it may be started at the same time as the heparin (the heparin needs to be continued for at least 5 days and until the INR has been in the therapeutic range for 2 consecutive days). Laboratory monitoring of coagulation activity, preferably on a daily basis, involves determination of the activated partial thromboplastin time (APTT) (for heparin (unfractionated) only) or of the anti-Factor Xa concentration (for low molecular weight heparins). Local guidelines on recommended APTT for neonates and children should be followed; monitoring of APTT should be discussed with a specialist prior to treatment for thrombotic episodes in neonates.

Treatment of venous thromboembolism in pregnancy

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 104, enoxaparin sodium p. 104 and tinzaparin sodium p. 106; see also under individual drugs. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage

If haemorrhage occurs, it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 953 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

For information on the management of haemorrhage in patients on oral anticoagulants, see Oral anticoagulants below.

Advanced Pharmacy Services

Patients with, or at risk of venous thromboembolism may be eligible for the New Medicines Service/Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

Useful Resources

Venous thromboembolism in over 16s: reducing the risk of hospital-acquired deep vein thrombosis or pulmonary embolism. National Institute for Health and Care Excellence. NICE guideline 89. March 2018 (updated August 2019). www.nice.org.uk/guidance/ng89

Oral anticoagulants

12-Feb-2021

Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Children prescribed an anticoagulant and their parents or carers should be provided with verbal and written information about the child's treatment, including how and when to seek medical attention. Immediate medical attention is required in certain children, such as in those with bleeding that is severe, does not stop or recurs, or who have other signs or symptoms of concern; in particular, children who have sustained a head injury should be referred to a hospital emergency department.

Vitamin K antagonists, such as warfarin, antagonise the effects of vitamin K and take at least 48 to 72 hours for the anticoagulant effect to develop fully; if an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

Uses

Warfarin sodium p. 109 [unlicensed] is the drug of choice for the treatment of systemic thromboembolism in children (not neonates) after initial heparinisation. It may also be used occasionally for the treatment of intravascular or intracardiac thrombi. Warfarin sodium is used prophylactically in those with chronic atrial fibrillation, dilated cardiomyopathy, certain forms of reconstructive heart surgery, mechanical prosthetic heart valves, and some forms of hereditary thrombophilia (e.g. homozygous protein C deficiency).

Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 98) is usually preferred for the prophylaxis of venous thromboembolism in children undergoing surgery; alternatively warfarin sodium can be continued in selected children currently taking warfarin sodium and who are at a high risk of thromboembolism (seek expert advice).

Dose

The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

An induction dose is usually given over 4 days. The subsequent maintenance dose depends on the prothrombin time, reported as INR (international normalised ratio) and should be taken at the same time each day.

Target INR

The following indications and target INRs for adults for warfarin take into account recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324:

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:

- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction

INR 3.5 for:

- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2;

Mechanical prosthetic heart valves:

- the recommended target INR depends on the type and location of the valve, and patient-related risk factors
- consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Haemorrhage

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytomenadione (vitamin K_1) p. 725 by slow intravenous injection; give dried prothrombin complex (factors II, VII, IX, and X) p. 89; if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium; give phytomenadione (vitamin K_1) by slow intravenous injection; repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytomenadione (vitamin K_1) by mouth using the intravenous preparation orally [unlicensed use]; repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phytomenadione (vitamin K_1) by slow intravenous injection; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, no bleeding—withhold 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Advanced Pharmacy Services

Children taking oral anticoagulants may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

Parenteral anticoagulants

12-Feb-2021

Anticoagulants

Although thrombotic episodes are uncommon in childhood, anticoagulants may be required in children with congenital heart disease; in children undergoing haemodialysis; for preventing thrombosis in children requiring chemotherapy and following surgery; and for systemic venous thromboembolism secondary to inherited thrombophilias, systemic lupus erythematosus, or indwelling central venous catheters.

Children prescribed an anticoagulant and their parents or carers should be provided with verbal and written information about the child's treatment, including how and when to seek medical attention. Immediate medical attention is required in certain children, such as in those with bleeding that is severe, does not stop or recurs, or who have other signs or symptoms of concern; in particular, children who have sustained a head injury should be referred to a hospital emergency department.

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is now often referred to as being **standard** or heparin (unfractionated) p. 105 to distinguish it from the **low molecular weight heparins**, which have a longer duration of action. For children at high risk of bleeding, heparin (unfractionated) is more suitable than low molecular weight heparin because its effect can be terminated rapidly by stopping the infusion.

Heparins are used in both the treatment and prophylaxis of thromboembolic disease, mainly to prevent further clotting rather than to lyse existing clots—surgery or a thrombolytic drug may be necessary if a thrombus obstructs major vessels.

Low molecular weight heparins

Dalteparin sodium p. 104, enoxaparin sodium p. 104, and tinzaparin sodium p. 106 are low molecular weight heparins used for treatment and prophylaxis of thrombotic episodes in children. Their duration of action is longer than that of heparin (unfractionated) and in adults and older children *once-daily subcutaneous* dosage is sometimes possible; however, younger children require relatively higher doses (possibly due to larger volume of distribution, altered heparin pharmacokinetics, or lower plasma concentrations of antithrombin) and twice daily dosage is sometimes necessary. Low molecular weight heparins are convenient to use, especially in children with poor venous access.

Heparinoids

Danaparoid sodium p. 103 is a heparinoid that has a role in children who develop heparin-induced thrombocytopenia, providing they have no evidence of cross-reactivity.

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol

Epoprostenol (prostacyclin) p. 132 can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is a potent vasodilator and therefore its side-effects include flushing, headache and hypotension.

Other drugs used for Thromboembolism Alteplase, p. 95 · Streptokinase, p. 95

Antiplatelet drugs

Overview

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Aspirin below has limited use in children because it has been associated with Reye's syndrome. Aspirin-containing preparations should not be given to children and adolescents under 16 years, unless specifically indicated, such as for Kawasaki disease, for prophylaxis of clot formation after cardiac surgery, or for prophylaxis of stroke in children at high risk.

If aspirin causes dyspepsia, or if the child is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor or a H_2-receptor antagonist can be added.

Dipyridamole p. 100 is also used as an antiplatelet drug to prevent clot formation after cardiac surgery and may be used with specialist advice for treatment of persistent coronary artery aneurysms in Kawasaki disease.

Kawasaki disease

Initial treatment is with high dose aspirin and a single dose of intravenous normal immunoglobulin; this combination has an additive anti-inflammatory effect resulting in faster resolution of fever and a decreased incidence of coronary artery complications. After the acute phase, when the patient is afebrile, aspirin is continued at a lower dose to prevent coronary artery abnormalities.

Advanced Pharmacy Services

Children taking antiplatelet drugs may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

Aspirin

07-Dec-2021

(Acetylsalicylic Acid)

● **INDICATIONS AND DOSE**

Antiplatelet | Prevention of thrombus formation after cardiac surgery

▸ BY MOUTH

- Neonate: 1–5 mg/kg once daily.
- Child 1 month-11 years: 1–5 mg/kg once daily (max. per dose 75 mg)
- Child 12-17 years: 75 mg once daily

Kawasaki disease

▸ BY MOUTH

- Neonate: Initially 8 mg/kg 4 times a day for 2 weeks *or* until afebrile, followed by 5 mg/kg once daily for 6–8 weeks, if no evidence of coronary lesions after 8 weeks, discontinue treatment or seek expert advice.
- Child 1 month-11 years: Initially 7.5–12.5 mg/kg 4 times a day for 2 weeks *or* until afebrile, then 2–5 mg/kg once daily for 6–8 weeks, if no evidence of coronary lesions after 8 weeks, discontinue treatment or seek expert advice

Mild to moderate pain (dose approved for use by community practitioner nurse prescribers) | Pyrexia (dose approved for use by community practitioner nurse prescribers)

▸ BY MOUTH

- Child 16-17 years: 300–600 mg every 4–6 hours as required, maximum 2.4 g per day without doctor's advice

● **UNLICENSED USE** Not licensed for use in children under 16 years.

● **CONTRA-INDICATIONS** Active peptic ulceration · bleeding disorders · children under 16 years (risk of Reye's syndrome) · haemophilia · previous peptic ulceration (analgesic dose) · severe cardiac failure (analgesic dose)

CONTRA-INDICATIONS, FURTHER INFORMATION

- Reye's syndrome Owing to an association with Reye's syndrome, manufacturer advises aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.

● **CAUTIONS** Allergic disease · anaemia · asthma · dehydration · G6PD deficiency · hypertension · may mask symptoms of infection · preferably avoid during fever or viral infection in children (risk of Reye's syndrome) · previous peptic ulceration (but manufacturers may advise avoidance of aspirin in history of peptic ulceration) · thyrotoxicosis

● **INTERACTIONS** → Appendix 1: aspirin

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare or very rare** Asthmatic attack · bronchospasm

SPECIFIC SIDE-EFFECTS

- **Common or very common** Dyspepsia · haemorrhage
- **Uncommon** Dyspnoea · rhinitis · severe cutaneous adverse reactions (SCARs) · skin reactions
- **Rare or very rare** Aplastic anaemia · erythema nodosum · gastrointestinal haemorrhage (severe) · granulocytosis · haemorrhagic vasculitis · intracranial haemorrhage · menorrhagia · nausea · thrombocytopenia · vomiting
- **Frequency not known** Fluid retention · gastrointestinal disorders · headache · hearing loss · hepatic failure · hyperuricaemia · iron deficiency anaemia · renal impairment · sodium retention · tinnitus · vertigo

Overdose The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning.

For specific details on the management of poisoning, see Aspirin, under Emergency treatment of poisoning p. 944.

● **ALLERGY AND CROSS-SENSITIVITY** EvGr Aspirin is **contra-indicated** in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID. Ⓜ

● **PREGNANCY** Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of

haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine growth restriction, teratogenic effects, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.

- **BREAST FEEDING** Avoid—possible risk of Reye's syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** EvGr Caution in mild to moderate impairment (risk of fluid retention, further renal impairment, and gastro-intestinal bleeding); avoid in severe impairment. Ⓜ
- **PATIENT AND CARER ADVICE**

ANTITHROMBOTIC DRUGS › FACTOR Xa INHIBITORS

Rivaroxaban

24-Jan-2022

- **DRUG ACTION** Rivaroxaban is a direct inhibitor of activated factor X (factor Xa).

- **INDICATIONS AND DOSE**

Treatment of venous thromboembolism | Prophylaxis of recurrent venous thromboembolism

- BY MOUTH
  - Neonate (body-weight 2.6 kg and above): (consult product literature).
  - Child (body-weight 2.6–2.9 kg): 0.8 mg 3 times a day for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, review dose and body-weight regularly, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
  - Child (body-weight 3–3.9 kg): 0.9 mg 3 times a day for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, review dose and body-weight regularly, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
  - Child (body-weight 4–4.9 kg): 1.4 mg 3 times a day for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, review dose and body-weight regularly, for dose adjustments before and after invasive procedures, surgical

intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk

- Child (body-weight 5–6.9 kg): 1.6 mg 3 times a day for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, review dose and body-weight regularly, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
- Child (body-weight 7–7.9 kg): 1.8 mg 3 times a day for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, review dose and body-weight regularly, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
- Child (body-weight 8–8.9 kg): 2.4 mg 3 times a day for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, review dose and body-weight regularly, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
- Child (body-weight 9–9.9 kg): 2.8 mg 3 times a day for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, review dose and body-weight regularly, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
- Child (body-weight 10–11.9 kg): 3 mg 3 times a day for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, review dose and body-weight regularly, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
- Child (body-weight 12–29.9 kg): 5 mg twice daily for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
- Child (body-weight 30–49.9 kg): 15 mg once daily for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk
- Child (body-weight 50 kg and above): 20 mg once daily for at least 3 months, following completion of at least 5 days of initial parenteral anticoagulant treatment, for dose adjustments before and after invasive procedures, surgical intervention and for duration of treatment for catheter related thrombosis—consult product literature, treatment can be extended up to 12 months if required, taking into account the risk for recurrent thrombosis versus the potential bleeding risk

DOSE EQUIVALENCE AND CONVERSION

- For information on changing from, or to, other anticoagulants—consult product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: NEW ORAL ANTICOAGULANTS APIXABAN (*ELIQUIS*®), DABIGATRAN (*PRADAXA*®) AND RIVAROXABAN (*XARELTO*®) (OCTOBER 2013)

The following contra-indications now apply to all new oral anticoagulants, for all indications and doses:

- a lesion or condition, if considered a significant risk factor for major bleeding—see *Contra-indications* for further information;
- concomitant treatment with any other anticoagulant agent—see *Contra-indications* for further information.

Healthcare professionals are advised to take caution when deciding to prescribe these anticoagulants to patients with other conditions, undergoing other procedures, and on other treatments, which may increase the risk of major bleeding. The renal function of patients should also be considered.

MHRA/CHM ADVICE: RIVAROXABAN (*XARELTO*®) AFTER TRANSCATHETER AORTIC VALVE REPLACEMENT: INCREASE IN ALL-CAUSE MORTALITY, THROMBOEMBOLIC AND BLEEDING EVENTS IN A CLINICAL TRIAL (OCTOBER 2018)

A phase 3 clinical trial showed that the risk of all-cause death and bleeding after transcatheter aortic valve replacement (TAVR) approximately doubled in patients assigned to a rivaroxaban-based anticoagulation strategy compared with those receiving an antiplatelet-based strategy (clopidogrel and aspirin). The MHRA reminds healthcare professionals that rivaroxaban should not be used for thromboprophylaxis in patients with prosthetic heart valves, including patients who have undergone TAVR. Rivaroxaban treatment in patients who undergo TAVR should be stopped and switched to standard of care.

MHRA/CHM ADVICE: DIRECT-ACTING ORAL ANTICOAGULANTS (DOACS): INCREASED RISK OF RECURRENT THROMBOTIC EVENTS IN PATIENTS WITH ANTIPHOSPHOLIPID SYNDROME (JUNE 2019)

A clinical trial has shown an increased risk of recurrent thrombotic events associated with rivaroxaban compared with warfarin, in patients with antiphospholipid syndrome and a history of thrombosis. There may be a similar risk associated with other DOACs. Healthcare professionals are advised that DOACs are not recommended in patients with antiphospholipid syndrome, particularly high-risk patients who test positive for all three antiphospholipid tests—lupus anticoagulant, anticardiolipin antibodies, and anti-beta$_2$ glycoprotein I antibodies. Continued treatment should be reviewed in these patients to determine if appropriate, and switching to a vitamin K antagonist such as warfarin should be considered.

MHRA/CHM ADVICE: RIVAROXABAN (*XARELTO*®): REMINDER THAT 15 MG AND 20 MG TABLETS SHOULD BE TAKEN WITH FOOD (JULY 2019)

The MHRA has received a small number of reports suggesting a lack of efficacy (thromboembolic events) in patients taking 15 mg or 20 mg rivaroxaban tablets on an empty stomach. Healthcare professionals are advised to

remind patients to take rivaroxaban 15 mg or 20 mg tablets with food. In those who have difficulty swallowing, these tablets can be crushed and mixed with water or apple puree immediately before, and followed by food immediately after, ingestion.

MHRA/CHM ADVICE: DIRECT-ACTING ORAL ANTICOAGULANTS (DOACS): REMINDER OF BLEEDING RISK, INCLUDING AVAILABILITY OF REVERSAL AGENTS (JUNE 2020)

The MHRA reminds healthcare professionals to remain vigilant for signs and symptoms of bleeding complications during treatment with rivaroxaban after ongoing reports of serious, potentially fatal bleeds associated with the use of DOACs. Healthcare professionals are also advised to use rivaroxaban with caution in patients with increased bleeding risk, and to ensure that those with renal impairment are dosed appropriately and their renal function monitored during treatment. Patients and their carers should be counselled on the signs and symptoms of bleeding, and encouraged to read the patient information leaflet.

MHRA/CHM ADVICE: WARFARIN AND OTHER ANTICOAGULANTS: MONITORING OF PATIENTS DURING THE COVID-19 PANDEMIC (OCTOBER 2020)

Healthcare professionals are reminded that:

- direct-acting oral anticoagulants (DOACs), such as rivaroxaban, may interact with other medicines (including antibacterials and antivirals)—advice in product literature should be followed to minimise the risk of potential interactions;
- if patients are switched from warfarin to rivaroxaban, warfarin treatment should be stopped before rivaroxaban treatment is started to reduce the risk of over-anticoagulation and bleeding.

- **CONTRA-INDICATIONS** Active bleeding · antiphospholipid syndrome (increased risk of recurrent thrombotic events) · arteriovenous malformation · less than 6 months of age with less than 10 days of oral feeding and who at birth had less than 37 weeks of gestation · major intraspinal or intracerebral vascular abnormalities · malignant neoplasms at high risk of bleeding · oesophageal varices · prosthetic heart valve (efficacy not established) · recent brain or spinal injury · recent brain surgery · recent gastrointestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · use with any other anticoagulant · vascular aneurysm

CONTRA-INDICATIONS, FURTHER INFORMATION

- Use with any other anticoagulant EvGr Concomitant use with any other anticoagulant is contra-indicated, except when switching therapy, or when unfractionated heparin is given at doses necessary to maintain an open central venous or arterial catheter or for catheter ablation—use with caution. M

- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and consider placement or removal of a catheter when the anticoagulant effect of rivaroxaban is estimated to be low) · bronchiectasis · cerebral vein and sinus thrombosis in CNS infection · risk of bleeding · severe hypertension · vascular retinopathy

- **INTERACTIONS** → Appendix 1: factor XA inhibitors

- **SIDE-EFFECTS**

- **Common or very common** Anaemia · asthenia · constipation · diarrhoea · dizziness · fever · gastrointestinal discomfort · haemorrhage · headache · hypotension · menorrhagia · nausea · oedema · pain in extremity · post procedural anaemia · renal impairment · skin reactions · tachycardia · vomiting · wound complications
- **Uncommon** Angioedema · dry mouth · hepatic disorders · hypersensitivity · intracranial haemorrhage · malaise · syncope · thrombocytopenia · thrombocytosis
- **Rare or very rare** Severe cutaneous adverse reactions (SCARs) · vascular pseudoaneurysm

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in hepatic disease with coagulopathy and clinically-relevant bleeding risk including patients with moderate to severe cirrhosis.
- **RENAL IMPAIRMENT** See p. 15. EvGr Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature). M EvGr Avoid in children 1 year or older if estimated glomerular filtration rate less than 50 ml/min/1.73 min^2 and in children under 1 year with serum creatinine results above 97.5th percentile—consult product literature. M
- **MONITORING REQUIREMENTS**
- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets may be crushed and mixed with water or apple puree just before administration.

  For *Xarelto*® granules for oral suspension, the appropriate blue syringes (1 mL, 5 mL or 10 mL) should be used to ensure accurate dosing. Each dose should be immediately followed by one typical serving of liquid; this may include the liquid volume used for feeding. Reconstituted oral suspension should be discarded after 14 days.

  Once reconstituted, *Xarelto*® granules for oral suspension may be given through a nasogastric or gastric feeding tube—consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Xarelto*® has provided a *Prescriber Guide*.

  Xarelto® granules for oral suspension should be used in patients with a body-weight of at least 2.6 kg to less than 30 kg. Do not split or use lower strength *Xarelto*® tablets to provide doses for children with body-weight below 30 kg; only *Xarelto*® 15 mg tablets and *Xarelto*® 20 mg tablets are licensed for use in children and adolescents aged less than 18 years.

  Xarelto® granules for oral suspension contains sodium benzoate which may increase jaundice in newborn infants (up to four weeks old).

- **PATIENT AND CARER ADVICE** Patients and their carers should be given advice on how to administer *Xarelto*® granules for oral suspension.

  Vomiting If vomiting occurs within 30 minutes after receiving the dose, a new dose should be given. The dose should not be re-administered if vomiting occurs after 30 minutes.

  Patients and their carers should be provided with an alert card and advised to keep it with them at all times.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

All Wales Medicines Strategy Group (AWMSG) decisions

- **Rivaroxaban (*Xarelto*®) for the treatment of venous thromboembolism (VTE) and prevention of VTE recurrence in term neonates, infants and toddlers, children, and adolescents aged less than 18 years after at least 5 days of initial parenteral anticoagulation treatment (December 2021)** AWMSG No. 3875 Recommended

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 10, 21
EXCIPIENTS: May contain Propylene glycol

▸ **Xarelto** (Bayer Plc) ▼

Rivaroxaban 1 mg per 1 ml Xarelto 1mg/ml granules for oral suspension sugar-free | 100 ml PoM £9.00 (Hospital only) sugar-free | 250 ml PoM £18.00 DT = £18.00

Tablet

ANTITHROMBOTIC DRUGS › HEPARINOIDS

Danaparoid sodium

13-Jan-2021

● **INDICATIONS AND DOSE**

Thromboembolic disease in patients with history of heparin-induced thrombocytopenia

▸ INITIALLY BY INTRAVENOUS INJECTION

▸ Neonate: Initially 30 units/kg, then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity.

▸ Child 1 month–15 years (body-weight up to 55 kg): Initially 30 units/kg (max. per dose 1250 units), then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity

▸ Child 1 month–15 years (body-weight 55 kg and above): Initially 30 units/kg (max. per dose 2500 units), then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity

▸ Child 16–17 years (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity

▸ Child 16–17 years (body-weight 55–90 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity

▸ Child 16–17 years (body-weight 91 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity

● **UNLICENSED USE** Not licensed for use in children.

● **CONTRA-INDICATIONS** Active peptic ulcer (unless this is the reason for operation) · acute bacterial endocarditis · diabetic retinopathy · epidural anaesthesia (with treatment doses) · haemophilia and other haemorrhagic disorders · recent cerebral haemorrhage · severe uncontrolled hypertension · spinal anaesthesia (with treatment doses) · thrombocytopenia (unless patient has heparin-induced thrombocytopenia)

● **CAUTIONS** Antibodies to heparins (risk of antibody-induced thrombocytopenia) · body-weight over 90 kg · recent bleeding · risk of bleeding

● **INTERACTIONS** → Appendix 1: danaparoid

● **SIDE-EFFECTS**

▸ **Common or very common** Haemorrhage · heparin-induced thrombocytopenia · skin reactions · thrombocytopenia

▸ **Uncommon** Post procedural haematoma

▸ **Rare or very rare** Anastomotic haemorrhage

● **PREGNANCY** Manufacturer advises avoid—limited information available but not known to be harmful.

● **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment with impaired haemostasis—increased risk of bleeding; avoid in severe hepatic failure unless patient has heparin-induced thrombocytopenia and no alternative available.

● **RENAL IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

Monitoring Increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity.

● **MONITORING REQUIREMENTS** Monitor anti factor Xa activity in patients with body-weight over 90 kg.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▸ **Danaparoid sodium (Non-proprietary)**

Danaparoid sodium 1250 unit per 1 ml Danaparoid sodium 750units/0.6ml solution for injection ampoules | 10 ampoule PoM £599.99 (Hospital only)

ANTITHROMBOTIC DRUGS › HEPARINS

Heparins

● **CONTRA-INDICATIONS** Acute bacterial endocarditis · after major trauma · avoid injections containing benzyl alcohol in neonates · epidural anaesthesia with treatment doses · haemophilia or other haemorrhagic disorders · peptic ulcer · recent cerebral haemorrhage · recent surgery to eye · recent surgery to nervous system · spinal anaesthesia with treatment doses · thrombocytopenia (including history of heparin-induced thrombocytopenia)

● **CAUTIONS** Risk of bleeding · severe hypertension

● **SIDE-EFFECTS**

▸ **Common or very common** Haemorrhage · heparin-induced thrombocytopenia · skin reactions

▸ **Rare or very rare** Alopecia · hyperkalaemia · osteoporosis (following long term use) · spinal haematoma

SIDE-EFFECTS, FURTHER INFORMATION **Haemorrhage**

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected

or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

- **MONITORING REQUIREMENTS**
  - Heparin-induced thrombocytopenia Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology's Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. *Br J Haematol* 2012; **159**: 528–540.
  - Hyperkalaemia Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

103

Dalteparin sodium

24-Nov-2021

- **INDICATIONS AND DOSE**

Treatment of thrombotic episodes

- BY SUBCUTANEOUS INJECTION
  - Neonate: 100 units/kg twice daily.
  - Child 1 month–11 years: 100 units/kg twice daily
  - Child 12–17 years: 200 units/kg once daily (max. per dose 18 000 units); reduced to 100 units/kg twice daily, dose reduced if increased risk of bleeding

Treatment of venous thromboembolism in pregnancy

- BY SUBCUTANEOUS INJECTION
  - Child 12–17 years (body-weight up to 50 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12–17 years (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12–17 years (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12–17 years (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

Prophylaxis of thrombotic episodes

- BY SUBCUTANEOUS INJECTION
  - Neonate: 100 units/kg once daily.
  - Child 1 month–11 years: 100 units/kg once daily
  - Child 12–17 years: 2500–5000 units once daily

- **UNLICENSED USE** Not licensed for treatment of venous thromboembolism in pregnancy.
  Not licensed for use in children.
- **CONTRA-INDICATIONS** Mechanical prosthetic heart valve
- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **SIDE-EFFECTS** Epidural haematoma · hypoaldosteronism · intracranial haemorrhage · prosthetic cardiac valve thrombosis
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated in hypersensitivity to unfractionated or low molecular weight heparin. M
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (increased risk of bleeding complications).
  Dose adjustments Manufacturer advises consider dose reduction in severe impairment.
- **RENAL IMPAIRMENT** Use of unfractionated heparin may be preferable.
  Dose adjustments Risk of bleeding may be increased—dose reduction may be required.
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- **Fragmin** (Pfizer Ltd)

Dalteparin sodium 2500 unit per 1 ml Fragmin 10,000units/4ml solution for injection ampoules | 10 ampoule PoM £51.22 DT = £51.22

Dalteparin sodium 10000 unit per 1 ml Fragmin Graduated Syringe 10,000units/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection PoM £28.23 DT = £28.23
Fragmin 10,000units/1ml solution for injection ampoules | 10 ampoule PoM £51.22 DT = £51.22

Dalteparin sodium 12500 unit per 1 ml Fragmin 2,500units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £18.58 DT = £18.58

Dalteparin sodium 25000 unit per 1 ml Fragmin 18,000units/0.72ml solution for injection pre-filled syringes | 5 pre-filled disposable injection PoM £50.82 DT = £50.82
Fragmin 15,000units/0.6ml solution for injection pre-filled syringes | 5 pre-filled disposable injection PoM £42.34 DT = £42.34
Fragmin 5,000units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £28.23 DT = £28.23
Fragmin 12,500units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection PoM £35.29 DT = £35.29
Fragmin 7,500units/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £42.34 DT = £42.34
Fragmin 100,000units/4ml solution for injection vials | 1 vial PoM £48.66 DT = £48.66
Fragmin 10,000units/0.4ml solution for injection pre-filled syringes | 5 pre-filled disposable injection PoM £28.23 DT = £28.23

103

Enoxaparin sodium

27-Aug-2021

- **INDICATIONS AND DOSE**

Treatment of thrombotic episodes

- BY SUBCUTANEOUS INJECTION
  - Neonate: 1.5–2 mg/kg twice daily.
  - Child 1 month: 1.5 mg/kg twice daily
  - Child 2 months–17 years: 1 mg/kg twice daily

Treatment of venous thromboembolism in pregnancy

- BY SUBCUTANEOUS INJECTION
  - Child 12–17 years (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
  - Child 12–17 years (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
  - Child 12–17 years (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight

- Child 12–17 years (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

Prophylaxis of thrombotic episodes

- BY SUBCUTANEOUS INJECTION

- Neonate: 750 micrograms/kg twice daily.

- Child 1 month: 750 micrograms/kg twice daily
- Child 2 months–17 years: 500 micrograms/kg twice daily; maximum 40 mg per day

DOSE EQUIVALENCE AND CONVERSION

- 1 mg equivalent to 100 units.

- **UNLICENSED USE** Not licensed for treatment of venous thromboembolism in pregnancy.
  Not licensed for use in children.
- **CONTRA-INDICATIONS** Mechanical prosthetic heart valve
- **CAUTIONS** Obesity (increased risk of thromboembolism)
- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **SIDE-EFFECTS**
  - **Common or very common** Haemorrhagic anaemia · headache · hypersensitivity · thrombocytopenia · thrombocytosis
  - **Uncommon** Hepatic disorders · injection site necrosis · intracranial haemorrhage
  - **Rare or very rare** Cutaneous vasculitis · eosinophilia
  - **Frequency not known** Acute generalised exanthematous pustulosis (AGEP)
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated in hypersensitivity to unfractionated or low molecular weight heparin. Ⓜ
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—avoid.
- **BREAST FEEDING** Manufacturer advises suitable for use during breast feeding—passage into breast milk and absorption by the nursing infant considered to be negligible due to the relatively high molecular weight of enoxaparin and inactivation in the gastro-intestinal tract.
- **HEPATIC IMPAIRMENT**
  Dose adjustments Reduce dose in severe impairment—risk of bleeding may be increased.
- **RENAL IMPAIRMENT** Risk of bleeding increased; use of unfractionated heparin may be preferable. Consult specialist sources.
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with enoxaparin, except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Enoxaparin sodium is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

103

Heparin (unfractionated)

18-Feb-2022

- **INDICATIONS AND DOSE**

Prevention of clotting in extracorporeal circuits

- TO THE DEVICE AS A FLUSH
- Child: (consult product literature)

Maintenance of neonatal umbilical arterial catheter

- Neonate: 0.5 unit/hour.

Treatment of thombotic episodes

- INITIALLY BY INTRAVENOUS INJECTION

- Neonate up to 35 weeks corrected gestational age: Initially 50 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT.

- Neonate: Initially 75 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT.

continued →

- Child 1–11 months: Initially 75 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT
- Child 1–17 years: Initially 75 units/kg, then (by continuous intravenous infusion) 20 units/kg/hour, adjusted according to APTT

▸ BY SUBCUTANEOUS INJECTION

- Child: 250 units/kg twice daily, adjusted according to APTT

Prophylaxis of thrombotic episodes

▸ BY SUBCUTANEOUS INJECTION

- Child: 100 units/kg twice daily (max. per dose 5000 units), adjusted according to APTT

Maintenance of cardiac shunts and critical stents

▸ TO THE DEVICE AS A FLUSH

- Child: (consult local protocol)

- **UNLICENSED USE** Check product literature for licensed use in children.
- **INTERACTIONS** → Appendix 1: heparin
- **SIDE-EFFECTS** Adrenal hypofunction · hypokalaemia · priapism · rebound hyperlipidaemia · thrombocytopenia
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Caution in hypersensitivity to low molecular weight heparin. Ⓜ
- **PREGNANCY** Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.
- **BREAST FEEDING** Not excreted into milk due to high molecular weight.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding in severe impairment (increased risk of bleeding complications).
  Dose adjustments Manufacturer advises consider dose reduction if used in severe impairment.
- **RENAL IMPAIRMENT** EvGr Use with caution. Ⓜ
  Dose adjustments EvGr Consider dose reduction in severe impairment (increased risk of bleeding). Ⓜ
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium chloride 0.9%.
- In neonates For *maintenance of neonatal umbilical arterial catheter*, dilute 50 units to a final volume of 50 mL with Sodium Chloride 0.45% or use ready-made bag containing 500 units in 500 mL Sodium Chloride 0.9%; infuse at 0.5 mL/hour. For *neonatal intensive care (treatment of thrombosis)*, dilute 1250 units/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 1 mL/hour provides a dose of 25 units/kg/hour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- **Heparin (unfractionated) (Non-proprietary)**

Heparin sodium 1000 unit per 1 ml Heparin sodium 1,000units/1ml solution for injection ampoules | 10 ampoule PoM £14.85 DT = £14.85
Heparin sodium 5,000units/5ml solution for injection vials | 10 vial PoM £16.50–£37.41 DT = £16.50

103

Tinzaparin sodium

27-Aug-2021

- **INDICATIONS AND DOSE**

Treatment of thrombotic episodes

▸ BY SUBCUTANEOUS INJECTION

- Child 1 month: 275 units/kg once daily
- Child 2–11 months: 250 units/kg once daily
- Child 1–4 years: 240 units/kg once daily
- Child 5–9 years: 200 units/kg once daily
- Child 10–17 years: 175 units/kg once daily

Treatment of venous thromboembolism in pregnancy

▸ BY SUBCUTANEOUS INJECTION

- Child 12–17 years: 175 units/kg once daily, dose based on early pregnancy body-weight

Prophylaxis of thrombotic episodes

▸ BY SUBCUTANEOUS INJECTION

- Child: 50 units/kg once daily

- **UNLICENSED USE** Not licensed for the treatment of venous thromboembolism in pregnancy.
  Not licensed for use in children.
- **CONTRA-INDICATIONS** Mechanical prosthetic heart valve
- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **SIDE-EFFECTS**
- **Common or very common** Anaemia
- **Rare or very rare** Angioedema · priapism · Stevens-Johnson syndrome · thrombocytosis
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated in hypersensitivity to unfractionated or low molecular weight heparin. Ⓜ
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight of tinzaparin and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturer advise avoid.

- **RENAL IMPAIRMENT** Risk of bleeding may be increased. Unfractionated heparin may be preferable. Manufacturer advises caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m^2.
  Monitoring In renal impairment monitoring of anti-Factor Xa may be required if estimated glomerular filtration rate less than 30 mL/minute/1.73 m^2.
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, sulfites

- **Tinzaparin sodium (Non-proprietary)**
  Tinzaparin sodium 10000 unit per 1 ml Tinzaparin sodium 3,500units/0.35ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £27.71–£29.79 DT = £29.79
  Tinzaparin sodium 4,500units/0.45ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £35.63–£38.30 DT = £38.30
  Tinzaparin sodium 2,500units/0.25ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £19.80–£21.29 DT = £21.29
- **Innohep** (LEO Pharma)
  Tinzaparin sodium 10000 unit per 1 ml Innohep 20,000units/2ml solution for injection vials | 10 vial PoM £110.94 DT = £110.94
  Tinzaparin sodium 20000 unit per 1 ml Innohep 18,000units/0.9ml solution for injection pre-filled syringes | 6 pre-filled disposable injection PoM £67.47 | 10 pre-filled disposable injection PoM £112.46 DT = £112.46
  Innohep 8,000units/0.4ml solution for injection pre-filled syringes | 6 pre-filled disposable injection PoM £29.99 | 10 pre-filled disposable injection PoM £49.98 DT = £49.98
  Innohep 40,000units/2ml solution for injection vials | 1 vial PoM £35.91 DT = £35.91 | 10 vial PoM £359.10
  Innohep 16,000units/0.8ml solution for injection pre-filled syringes | 6 pre-filled disposable injection PoM £59.98 | 10 pre-filled disposable injection PoM £99.96 DT = £99.96
  Innohep 12,000units/0.6ml solution for injection pre-filled syringes | 6 pre-filled disposable injection PoM £44.98 | 10 pre-filled disposable injection PoM £74.97 DT = £74.97
  Innohep 14,000units/0.7ml solution for injection pre-filled syringes | 6 pre-filled disposable injection PoM £52.42 | 10 pre-filled disposable injection PoM £87.36 DT = £87.36
  Innohep 10,000units/0.5ml solution for injection pre-filled syringes | 6 pre-filled disposable injection PoM £37.49 | 10 pre-filled disposable injection PoM £62.48 DT = £62.48

ANTITHROMBOTIC DRUGS › THROMBIN INHIBITORS, DIRECT

Dabigatran etexilate

18-Jan-2022

- **DRUG ACTION** Dabigatran etexilate is a direct thrombin inhibitor with a rapid onset of action.

- **INDICATIONS AND DOSE**

Treatment of venous thromboembolism | Prophylaxis of recurrent venous thromboembolism

- BY MOUTH
- Child 8 years (body-weight 11–12 kg): 75 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Child 8–13 years (body-weight 13–20 kg): 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Child 8–17 years (body-weight 21–30 kg): 150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Child 8–17 years (body-weight 31–40 kg): 185 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Child 8–17 years (body-weight 41–50 kg): 220 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Child 8–17 years (body-weight 51–60 kg): 260 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Child 8–17 years (body-weight 61 kg and above): 300 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

DOSE EQUIVALENCE AND CONVERSION

- For information on changing from, or to, other anticoagulants, consult product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: NEW ORAL ANTICOAGULANTS APIXABAN (*ELIQUIS*®), DABIGATRAN (*PRADAXA*®) AND RIVAROXABAN (*XARELTO*®) (OCTOBER 2013)

The following contra-indications now apply to all new oral anticoagulants, for all indications and doses:

- a lesion or condition, if considered a significant risk factor for major bleeding—see *Contra-indications* for further information;
- concomitant treatment with any other anticoagulant agent—see *Contra-indications* for further information.

Healthcare professionals are advised to take caution when deciding to prescribe these anticoagulants to patients with other conditions, undergoing other procedures, and on other treatments, which may increase the risk of major bleeding. The renal function of patients should also be considered.

MHRA/CHM ADVICE: DIRECT-ACTING ORAL ANTICOAGULANTS (DOACS): INCREASED RISK OF RECURRENT THROMBOTIC EVENTS IN PATIENTS WITH ANTIPHOSPHOLIPID SYNDROME (JUNE 2019)

A clinical trial has shown an increased risk of recurrent thrombotic events associated with rivaroxaban compared with warfarin, in patients with antiphospholipid syndrome and a history of thrombosis. There may be a similar risk associated with other DOACs. Healthcare professionals are advised that DOACs are not recommended in patients with antiphospholipid syndrome, particularly high-risk patients who test positive for all three antiphospholipid tests—lupus anticoagulant, anticardiolipin antibodies, and anti-$beta_2$ glycoprotein I antibodies. Continued treatment should be reviewed in these patients to determine if appropriate, and switching to a vitamin K antagonist such as warfarin should be considered.

MHRA/CHM ADVICE: DIRECT-ACTING ORAL ANTICOAGULANTS (DOACS): REMINDER OF BLEEDING RISK, INCLUDING AVAILABILITY OF REVERSAL AGENTS (JUNE 2020)

The MHRA reminds healthcare professionals to remain vigilant for signs and symptoms of bleeding complications during treatment with dabigatran after ongoing reports of serious, potentially fatal bleeds associated with the use of DOACs. Healthcare professionals are also advised to use dabigatran with caution in patients with increased bleeding risk, and to ensure that those with renal impairment are dosed appropriately and their renal function monitored during treatment. Patients and their carers should be counselled on the signs and symptoms of bleeding, and encouraged to read the patient information leaflet.

MHRA/CHM ADVICE: WARFARIN AND OTHER ANTICOAGULANTS: MONITORING OF PATIENTS DURING THE COVID-19 PANDEMIC (OCTOBER 2020)

Healthcare professionals are reminded that:

- direct-acting oral anticoagulants (DOACs), such as dabigatran, may interact with other medicines (including antibacterials and antivirals)—advice in product literature should be followed to minimise the risk of potential interactions;

- if patients are switched from warfarin to dabigatran, warfarin treatment should be stopped before dabigatran treatment is started to reduce the risk of over-anticoagulation and bleeding.

- **CONTRA-INDICATIONS** Active bleeding · antiphospholipid syndrome (increased risk of recurrent thrombotic events) · arteriovenous malformation · do not use as anticoagulant for prosthetic heart valve · major intraspinal or intracerebral vascular abnormalities · malignant neoplasms at high risk of bleeding · oesophageal varices · recent brain or spinal injury · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · use with any other anticoagulant · vascular aneurysm

CONTRA-INDICATIONS, FURTHER INFORMATION

- Use with any other anticoagulant EvGr Concomitant use with any other anticoagulant is contra-indicated, except when switching therapy, or when unfractionated heparin is given at doses necessary to maintain an open central venous or arterial catheter or for catheter ablation—use with caution. M

- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs) · bacterial endocarditis · bleeding disorders · encephalitis · gastritis · gastro-oesophageal reflux · intracranial abscess · meningitis (active) · oesophagitis · recent biopsy · recent major trauma · risk of bleeding · small bowel disease where absorption may be affected (consider parenteral anticoagulant) · thrombocytopenia

- **INTERACTIONS** → Appendix 1: thrombin inhibitors

- **SIDE-EFFECTS**
  - **Common or very common** Alopecia · anaemia · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · nausea · skin reactions · thrombocytopenia · vomiting
  - **Uncommon** Dysphagia · hyperbilirubinaemia · intracranial haemorrhage · neutropenia
  - **Frequency not known** Agranulocytosis · angioedema · bronchospasm · hepatic function abnormal

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment; consider avoiding in those with liver enzymes greater than 2 times the upper limit of normal (no information available).

- **RENAL IMPAIRMENT** See p. 15. EvGr Avoid if estimated glomerular filtration rate less than 50 mL/min/1.73m^2. M

- **MONITORING REQUIREMENTS**
  - Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
  - No routine anticoagulant monitoring required (INR tests are unreliable).
  - Assess renal function (manufacturer recommends Schwartz formula to calculate estimated glomerular filtration rate) before treatment in all patients and thereafter when clinically indicated.

- **DIRECTIONS FOR ADMINISTRATION** EvGr When dose reduction recommended due to concurrent amiodarone or verapamil, doses should be taken at the same time M (see *Indications and dose*).

- **PRESCRIBING AND DISPENSING INFORMATION** Patients should be assessed for their ability to swallow capsules before starting treatment. *Pradaxa*® capsules should not be given to patients unable or unwilling to swallow the capsule whole.

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to contact their doctor if gastrointestinal symptoms such as dyspepsia develop during treatment.

  Patients and their carers should be provided with an alert card and advised to keep it with them at all times.

  Missed doses EvGr If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. M

- **NATIONAL FUNDING/ACCESS DECISIONS**

    Dabigatran etexilate (as Dabigatran etexilate mesilate) 75 mg Pradaxa 75mg capsules | 10 capsule PoM £8.50 | 60 capsule PoM £51.00 DT = £51.00

    Dabigatran etexilate (as Dabigatran etexilate mesilate) 110 mg Pradaxa 110mg capsules | 10 capsule PoM £8.50 | 60 capsule PoM £51.00 DT = £51.00

    Dabigatran etexilate (as Dabigatran etexilate mesilate) 150 mg Pradaxa 150mg capsules | 60 capsule PoM £51.00 DT = £51.00

ANTITHROMBOTIC DRUGS › VITAMIN K ANTAGONISTS

Vitamin K antagonists

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

A EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: WARFARIN AND OTHER ANTICOAGULANTS: MONITORING OF PATIENTS DURING THE COVID-19 PANDEMIC (OCTOBER 2020)

Healthcare professionals are reminded that:

- acute illness (including COVID-19 infection) may exaggerate the effect of warfarin and necessitate a dose reduction;
- continued INR monitoring is important in patients taking warfarin or other vitamin K antagonists if they have suspected or confirmed COVID-19 infection, so they can be clinically managed at an early stage to reduce the risk of bleeding;
- vitamin K antagonists may interact with other medicines (including antibacterials and antivirals)—advice in product literature, such as INR monitoring in patients taking vitamin K antagonists who have recently started new medicines, should be followed to minimise the risk of potential interactions.

Patients on vitamin K antagonists (and their carers) should be reminded to carefully follow instructions for use (including the patient information leaflet) and advised to notify their GP or healthcare team if they:

- have symptoms of, or confirmed, COVID-19 infection;

- are otherwise unwell with sickness or diarrhoea, or have lost their appetite;
- have changed their diet, smoking habits, or alcohol consumption;
- are taking any new medicines or supplements;
- are unable to attend their next scheduled blood test for any reason.

- **CONTRA-INDICATIONS** Avoid use within 48 hours postpartum · haemorrhagic stroke · significant bleeding
- **CAUTIONS** Bacterial endocarditis (use only if warfarin otherwise indicated) · conditions in which risk of bleeding is increased · history of gastrointestinal bleeding · hyperthyroidism · hypothyroidism · peptic ulcer · recent ischaemic stroke · recent surgery · uncontrolled hypertension
- **SIDE-EFFECTS**
  - **Common or very common** Haemorrhage
  - **Rare or very rare** Alopecia · nausea · vomiting
  - **Frequency not known** Blue toe syndrome · CNS haemorrhage · diarrhoea · fever · haemothorax · jaundice · pancreatitis · skin necrosis (increased risk in patients with protein C or protein S deficiency) · skin reactions
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should be warned of the danger of teratogenicity.
- **PREGNANCY** Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment; avoid in severe impairment.
- **MONITORING REQUIREMENTS**
  - The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
  - It is essential that the INR be determined daily or on alternate days in early days of treatment, *then* at longer intervals (depending on response), *then* up to every 12 weeks.
  - Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.
- **PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In **England**, **Wales**, and **Northern Ireland**, they are available for purchase from:

  3M Security Print and Systems Limited
  Gorse Street, Chadderton
  Oldham
  OL9 9QH
  Tel: 0845 610 1112

  GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk.

  In **Scotland**, treatment booklets and starter information packs can be obtained by emailing stockorders.DPPAS@apsgroup.co.uk or by fax on (0131) 6299 967

  Electronic copies of the warfarin anticoagulant alert card and record booklet are also available as risk minimisation materials at www.medicines.org.uk/emc/rmm-directory/.

108

Warfarin sodium

19-Jan-2021

- **INDICATIONS AND DOSE**

Treatment and prophylaxis of thrombotic episodes (induction)

▸ BY MOUTH

- Neonate (initiated under specialist supervision): Initially 200 micrograms/kg for 1 dose on day 1, then reduced to 100 micrograms/kg once daily for the following 3 days, subsequent doses dependent on INR levels, induction dose may need to be altered according to condition (e.g. abnormal liver function tests, cardiac failure), concomitant interacting drugs, and if baseline INR above 1.3.
- Child: Initially 200 micrograms/kg (max. per dose 10 mg) for 1 dose on day 1, then reduced to 100 micrograms/kg once daily (max. per dose 5 mg) for the following 3 days, subsequent doses adjusted according to INR levels, induction dose may need to be altered according to condition (e.g. abnormal liver function tests, cardiac failure), concomitant interacting drugs, and if baseline INR above 1.3

Treatment and prophylaxis of thrombotic episodes following induction dose (if INR still below 1.4)

▸ BY MOUTH

- Neonate (under expert supervision): 200 micrograms/kg once daily.
- Child: 200 micrograms/kg once daily (max. per dose 10 mg)

Treatment and prophylaxis of thrombotic episodes following induction dose (if INR above 3.0)

▸ BY MOUTH

- Neonate (under expert supervision): 50 micrograms/kg once daily.
- Child: 50 micrograms/kg once daily (max. per dose 2.5 mg)

Treatment and prophylaxis of thrombotic episodes following induction dose (if INR above 3.5)

▸ BY MOUTH

- Neonate (under expert supervision): Dose to be omitted.
- Child: Dose to be omitted

Treatment and prophylaxis of thrombotic episodes (usual maintenance)

▸ BY MOUTH

- Neonate (under expert supervision): Maintenance 100–300 micrograms/kg once daily, doses up to 400 micrograms/kg once daily may be required especially if bottle fed, to be adjusted according to INR.
- Child: Maintenance 100–300 micrograms/kg once daily, doses up to 400 micrograms/kg once daily may be required especially if bottle fed, to be adjusted according to INR

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: WARFARIN: REPORTS OF CALCIPHYLAXIS (JULY 2016)

An EU-wide review has concluded that on rare occasions, warfarin use may lead to calciphylaxis—patients should

be advised to consult their doctor if they develop a painful skin rash; if calciphylaxis is diagnosed, appropriate treatment should be started and consideration should be given to stopping treatment with warfarin. The MHRA has advised that calciphylaxis is most commonly observed in patients with known risk factors such as end-stage renal disease, however cases have also been reported in patients with normal renal function.

- **CAUTIONS** Postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery)
- **INTERACTIONS** → Appendix 1: coumarins
- **SIDE-EFFECTS** Calciphylaxis • hepatic function abnormal
- **PREGNANCY** Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phytomenadione (vitamin K_1).
- **BREAST FEEDING** Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment.
  Monitoring In severe renal impairment, monitor INR more frequently.
- **PRESCRIBING AND DISPENSING INFORMATION**
  Dietary differences Infant formula is supplemented with vitamin K, which makes formula-fed infants resistant to warfarin; they may therefore need higher doses. In contrast breast milk contains low concentrations of vitamin K making breast-fed infants more sensitive to warfarin.
- **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.
  Medicines for Children leaflet: Warfarin for the treatment and prevention of thrombosis www.medicinesforchildren.org.uk/medicines/warfarin-for-the-treatment-and-prevention-of-thrombosis/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

4 Blood pressure conditions

4.1 Hypertension

Hypertension

24-Jan-2022

Overview

Hypertension in children and adolescents can have a substantial effect on long-term health. Possible causes of hypertension (e.g. congenital heart disease, renal disease and endocrine disorders) and the presence of any complications (e.g. left ventricular hypertrophy) should be established. Treatment should take account of contributory factors and any factors that increase the risk of cardiovascular complications.

Serious hypertension is rare in *neonates* but it can present with signs of congestive heart failure; the cause is often renal and can follow embolic arterial damage.

Children (or their parents or carers) should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include weight reduction (in obese children), reduction of dietary salt, reduction of total and saturated fat, increasing exercise, increasing fruit and vegetable intake, and not smoking (for guidance on stopping smoking, see Smoking cessation p. 330).

Indications for antihypertensive therapy in children include symptomatic hypertension, secondary hypertension, hypertensive target-organ damage, diabetes mellitus, persistent hypertension despite lifestyle measures, and pulmonary hypertension. The effect of antihypertensive treatment on growth and development is not known; treatment should be started only if benefits are clear.

Antihypertensive therapy should be initiated with a single drug at the lowest recommended dose; the dose can be increased until the target blood pressure is achieved. Once the highest recommended dose is reached, or sooner if the patient begins to experience side-effects, a second drug may be added if blood pressure is not controlled. If more than one drug is required, these should be given as separate products to allow dose adjustment of individual drugs, but fixed-dose combination products may be useful in adolescents if compliance is a problem.

Acceptable drug classes for use in children with hypertension include **ACE inhibitors**, **alpha-blockers**, **beta-blockers**, **calcium-channel blockers**, and **thiazide diuretics**. There is limited information on the use of **angiotensin-II receptor antagonists** in children. Diuretics and beta-blockers have a long history of safety and efficacy in children. The newer classes of antihypertensive drugs, including ACE inhibitors and calcium-channel blockers have been shown to be safe and effective in short-term studies in children. Refractory hypertension may require additional treatment with agents such as minoxidil p. 129 or clonidine hydrochloride p. 113.

Cardiovascular risk reduction

Aspirin p. 99 may be used to reduce the risk of cardiovascular events; however, concerns about an increased risk of bleeding and Reye's syndrome need to be considered.

A **statin** can be of benefit in older children who have a high risk of cardiovascular disease and have hypercholesterolaemia.

Hypertension in diabetes

Hypertension can occur in type 2 diabetes and treatment prevents both macrovascular and microvascular complications. ACE inhibitors may be considered in children with diabetes and microalbuminaemia or proteinuric renal disease. Beta-blockers are best avoided in children with, or at a high risk of developing, diabetes, especially when combined with a thiazide diuretic.

Hypertension in renal disease

ACE inhibitors may be considered in children with micro-albuminuria or proteinuric renal disease. High doses of loop diuretics may be required. Specific cautions apply to the use of ACE inhibitors in renal impairment, but ACE inhibitors may be effective. Dihydropyridine calcium-channel blockers may be added.

Hypertension in pregnancy

High blood pressure in pregnancy may usually be due to pre-existing essential hypertension or to pre-eclampsia. Methyldopa is safe in pregnancy. Beta-blockers are effective and safe in the third trimester. Modified-release preparations of nifedipine p. 121 [unlicensed] are also used for hypertension in pregnancy. Intravenous administration of labetalol hydrochloride p. 115 can be used to control hypertensive crises; alternatively hydralazine hydrochloride p. 129 can be given by the intravenous route.

Hypertensive emergencies

Hypertensive emergencies in children may be accompanied by signs of hypertensive encephalopathy, including seizures. Controlled reduction in blood pressure over 72–96 hours is essential; rapid reduction can reduce perfusion leading to organ damage. Treatment should be initiated with intravenous drugs; once blood pressure is controlled, oral therapy can be started. It may be necessary to infuse fluids particularly during the first 12 hours to expand plasma volume should the blood pressure drop too rapidly.

Controlled reduction of blood pressure is achieved by intravenous administration of labetalol hydrochloride or sodium nitroprusside p. 130. Esmolol hydrochloride p. 119 is useful for short-term use and has a short duration of action. Nicardipine hydrochloride p. 121 can be administered as a continuous intravenous infusion for life-threatening hypertension in paediatric intensive care settings. In less severe cases, nifedipine capsules can be used.

Other antihypertensive drugs which can be given intravenously include hydralazine hydrochloride and clonidine hydrochloride.

Hypertension in acute nephritis occurs as a result of sodium and water retention; it should be treated with sodium and fluid restriction, and with furosemide p. 154; antihypertensive drugs may be added if necessary.

Also see advice on short-term management of hypertensive episodes in phaeochromocytoma.

Phaeochromocytoma

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred. There is no nationwide consensus on the optimal drug regimen or doses used for the management of phaeochromocytoma.

Phenoxybenzamine hydrochloride p. 130, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects.

Pulmonary hypertension

Only pulmonary *arterial* hypertension is currently suitable for drug treatment. Pulmonary arterial hypertension includes persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension in children, and pulmonary hypertension related to congenital heart disease and cardiac surgery.

Some types of pulmonary hypertension are treated with vasodilator antihypertensive therapy and oxygen. Diuretics may also have a role in children with right-sided heart failure.

Initial treatment of *persistent pulmonary hypertension of the newborn* involves the administration of **nitric oxide**; epoprostenol p. 132 can be used until nitric oxide is available. Oral sildenafil p. 131 may be helpful in less severe cases. Epoprostenol and sildenafil can cause profound systemic hypotension. In rare circumstances either tolazoline p. 134 or magnesium sulfate p. 682 can be given by intravenous infusion when nitric oxide and epoprostenol have failed.

Treatment of *idiopathic pulmonary arterial hypertension* is determined by acute vasodilator testing; drugs used for treatment include calcium-channel blockers (usually nifedipine), long-term intravenous epoprostenol, nebulised iloprost p. 133, bosentan p. 131, or sildenafil. Anticoagulation (usually with warfarin sodium p. 109) may also be required to prevent secondary thrombosis.

Inhaled nitric oxide is a potent and selective pulmonary vasodilator. It acts on cyclic guanosine monophosphate (cGMP) resulting in smooth muscle relaxation. Inhaled nitric oxide is used in the treatment of persistent pulmonary hypertension of the newborn, and may also be useful in other forms of arterial pulmonary hypertension. Dependency can occur with high doses and prolonged use; to avoid rebound pulmonary hypertension the drug should be withdrawn gradually, often with the aid of sildenafil p. 131.

Excess nitric oxide can cause methaemoglobinaemia; therefore, methaemoglobin concentration should be measured regularly, particularly in neonates.

Nitric oxide increases the risk of haemorrhage by inhibiting platelet aggregation, but it does not usually cause bleeding.

Epoprostenol (prostacyclin) p. 132 is a prostaglandin and a potent vasodilator. It is used in the treatment of persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension, and in the acute phase following cardiac surgery. It is given by continuous 24-hour intravenous infusion.

Epoprostenol is a powerful inhibitor of platelet aggregation and there is a possible risk of haemorrhage. It is sometimes used as an antiplatelet in renal dialysis when heparins are unsuitable or contra-indicated. It can also cause serious systemic hypotension and, if withdrawn suddenly, can cause pulmonary hypertensive crisis.

Children on prolonged treatment can become tolerant to epoprostenol, and therefore require an increase in dose.

Iloprost p. 133 is a synthetic analogue of epoprostenol and is efficacious when nebulised in adults with pulmonary arterial hypertension, but experience in children is limited. It is more stable than epoprostenol and has a longer half-life.

Bosentan p. 131 is a dual endothelin receptor antagonist used orally in the treatment of pulmonary arterial hypertension. The concentration of endothelin, a potent vasoconstrictor, is raised in sustained pulmonary hypertension.

Sildenafil, a vasodilator developed for the treatment of erectile dysfunction, is also used for pulmonary arterial hypertension. It is used either alone or as an adjunct to other drugs.

Sildenafil is a selective phosphodiesterase type-5 inhibitor. Inhibition of this enzyme in the lungs enhances the vasodilatory effects of nitric oxide and promotes relaxation of vascular smooth muscle.

Sildenafil has also been used in pulmonary hypertension for weaning children off inhaled nitric oxide following cardiac surgery, and less successfully in idiopathic pulmonary arterial hypertension.

Tolazoline p. 134 is now rarely used to correct pulmonary artery vasospasm in pulmonary hypertension of the newborn as better alternatives are available. Tolazoline is an alpha-blocker and produces both pulmonary and systemic vasodilation.

Advanced Pharmacy Services

Children with hypertension may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

Antihypertensive drugs

Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** see Hypertension (hypertensive emergencies) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 129 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 130 is given by intravenous infusion to control severe hypertensive crisis when parenteral treatment is necessary. At low doses it reduces systemic vascular resistance and increases cardiac output; at high doses it can produce profound systemic hypotension—continuous blood pressure monitoring is therefore essential. Sodium nitroprusside may also be used to control paradoxical hypertension after surgery for coarctation of the aorta.

Minoxidil p. 129 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and children develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 154, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 113 and doxazosin p. 557 have alpha-blocking and vasodilator properties.

Centrally acting antihypertensive drugs

Methyldopa, a centrally acting antihypertensive, is of little value in the management of refractory sustained hypertension in infants and children. On prolonged use it is associated with fluid retention (which may be alleviated by concomitant use of diuretics).

Methyldopa is also effective for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 113 is also a centrally acting antihypertensive but has the disadvantage that sudden withdrawal may cause a hypertensive crisis. Clonidine hydrochloride is also used under specialist supervision for pain management, sedation, and opioid withdrawal, attention deficit hyperactivity disorder, and Tourette syndrome.

Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use in adults and are rarely used in children.

Alpha-adrenoceptor blocking drugs

Doxazosin and prazosin have post-synaptic alpha-blocking and vasodilator properties and rarely cause tachycardia. They can, however, reduce blood pressure rapidly after the first dose and should be introduced with caution.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

Drugs affecting the renin-angiotensin system

Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. The main indications of ACE inhibitors in children are shown below. In infants and young children, captopril p. 124 is often considered first.

Initiation under specialist supervision

Treatment with ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in children.

Heart failure

ACE inhibitors have a valuable role in all grades of heart failure, usually combined with a loop diuretic. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. Profound first-dose hypotension can occur when ACE inhibitors are introduced to children with heart failure who are already taking a high dose of a loop diuretic. Temporary withdrawal of the loop diuretic reduces the risk, but can cause severe rebound pulmonary oedema.

Hypertension

ACE inhibitors may be considered for hypertension when thiazides and beta-blockers are contra-indicated, not tolerated, or fail to control blood pressure; they may be considered for hypertension in children with type 1 diabetes with nephropathy. ACE inhibitors can reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

Diabetic nephropathy

ACE inhibitors also have a role in the management of diabetic nephropathy.

Renal effects

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below are present). Hyperkalaemia and other side-effects of ACE inhibitors are more common in children with impaired renal function and the dose may need to be reduced.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In children with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore contra-indicated in children known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in children with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in those with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If they are used in these circumstances renal function needs to be monitored.

ACE inhibitors should also be used with particular caution in children who may have undiagnosed and clinically silent renovascular disease. ACE inhibitors are useful for the management of hypertension and proteinuria in children with nephritis. They are thought to have a beneficial effect by reducing intra-glomerular hypertension and protecting the glomerular capillaries and membrane.

ACE inhibitors in combination with other drugs

Concomitant diuretics

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted children; treatment should therefore be initiated with very low doses. In some children the diuretic

dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Angiotensin-II receptor antagonists

Candesartan cilexetil p. 127, losartan potassium p. 128 and valsartan p. 128 are specific angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for children who have to discontinue an ACE inhibitor because of persistent cough.

Candesartan cilexetil, losartan potassium or valsartan can be used as an alternative to an ACE inhibitor in the management of hypertension.

Renal effects

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under ACE Inhibitors, above).

Neonates

The neonatal response to treatment with ACE inhibitors is very variable, and some neonates develop profound hypotension with even small doses; a test-dose should be used initially and increased cautiously. Adverse effects such as apnoea, seizures, renal failure, and severe unpredictable hypotension are very common in the first month of life and it is therefore recommended that ACE inhibitors are avoided whenever possible, particularly in preterm neonates.

Other drugs used for Hypertension Amiloride hydrochloride, p. 156 · Chlortalidone, p. 156 · Metolazone, p. 156

ALPHA-ADRENOCEPTOR BLOCKERS

Prazosin

05-May-2021

- **INDICATIONS AND DOSE**

Hypertension

- BY MOUTH
- Child 1 month-11 years: Initially 10–15 micrograms/kg 2–4 times a day, initial dose to be taken at bedtime, then increased to 500 micrograms/kg daily in divided doses, dose to be increased gradually; maximum 20 mg per day
- Child 12-17 years: Initially 500 micrograms 2–3 times a day for 3-7 days, initial dose to be taken at bedtime, then increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses, dose should be increased gradually

Congestive heart failure (rarely used)

- BY MOUTH
- Child 1 month-11 years: 5 micrograms/kg twice daily, initial dose to be taken at bedtime, then increased to 100 micrograms/kg daily in divided doses, doses should be increased gradually
- Child 12-17 years: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS** History of postural hypotension · not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · first dose hypotension
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
- **Common or very common** Asthenia · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · headache · nasal congestion · nausea · nervousness · oedema · palpitations · postural hypotension · sexual dysfunction · skin reactions · syncope · urinary disorders · vertigo · vision blurred · vomiting
- **Uncommon** Angina pectoris · arrhythmias · arthralgia · epistaxis · eye pain · eye redness · gastrointestinal discomfort · hyperhidrosis · paraesthesia · sleep disorders · tinnitus
- **Rare or very rare** Alopecia · fever · flushing · gynaecomastia · hallucination · hepatic function abnormal · pain · pancreatitis · vasculitis
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
  Dose adjustments In children 12 years and above, manufacturer advises initial dose reduction to 500 micrograms daily; increased with caution.
- **RENAL IMPAIRMENT**
  Dose adjustments In children 12 years and above, manufacturer advises initial dose reduction to 500 micrograms daily in moderate to severe impairment; increase with caution.
- **DIRECTIONS FOR ADMINISTRATION** Expert sources advise for administration *by mouth*, tablets may be dispersed in water.
- **PATIENT AND CARER ADVICE**
  First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed).
  Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Tablet

- Prazosin (Non-proprietary)
  Prazosin (as Prazosin hydrochloride) 2 mg Minipress 2mg tablets | 100 tablet PoM DT = £164.01
  Prazosin (as Prazosin hydrochloride) 5 mg Minipress 5mg tablets | 100 tablet PoM
- Hypovase (Pfizer Ltd)
  Prazosin (as Prazosin hydrochloride) 500 microgram Hypovase 500microgram tablets | 60 tablet PoM £2.69 DT = £2.69

ANTIHYPERTENSIVES, CENTRALLY ACTING

Clonidine hydrochloride

13-Dec-2021

- **INDICATIONS AND DOSE**

Severe hypertension

- BY MOUTH
- Child 2-17 years: Initially 0.5–1 microgram/kg 3 times a day, then increased if necessary up to 25 micrograms/kg daily in divided doses, increase dose gradually; maximum 1.2 mg per day

continued →

- BY SLOW INTRAVENOUS INJECTION
- Child 2–17 years: 2–6 micrograms/kg (max. per dose 300 micrograms) for 1 dose

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Severe bradyarrhythmia secondary to second- or third-degree AV block or sick sinus syndrome
- **CAUTIONS** Cerebrovascular disease · constipation · heart failure · history of depression · mild to moderate bradyarrhythmia · polyneuropathy · Raynaud's syndrome or other occlusive peripheral vascular disease
- **INTERACTIONS** → Appendix 1: clonidine
- **SIDE-EFFECTS**
- **Common or very common** Constipation · depression · dizziness · dry mouth · fatigue · headache · nausea · postural hypotension · salivary gland pain · sedation · sexual dysfunction · sleep disorders · vomiting
- **Uncommon** Delusions · hallucination · malaise · paraesthesia · Raynaud's phenomenon · skin reactions
- **Rare or very rare** Alopecia · atrioventricular block · dry eye · gynaecomastia · intestinal pseudo-obstruction · nasal dryness
- **Frequency not known** Accommodation disorder · arrhythmias · confusion
- **PREGNANCY** May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.
- **BREAST FEEDING** Avoid—present in milk.
- **RENAL IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** In adults, manufacturer advises adjust dose according to response (consult product literature).
- **TREATMENT CESSATION** Must be withdrawn gradually to avoid hypertensive crisis.
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For *intravenous injection*, manufacturer advises give over 10–15 minutes; compatible with Sodium Chloride 0.9% *or* Glucose 5%.
- With oral use For administration *by mouth*, expert sources advise *Catapres*® tablets may be crushed and dissolved in water.
- **PATIENT AND CARER ADVICE** **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Clonidine is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

BETA-ADRENOCEPTOR BLOCKERS

Beta-adrenoceptor blocking drugs

Overview

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are available but experience in children is limited to the use of only a few.

Differences between beta-blockers may affect choice. Water-soluble beta-blockers (such as atenolol p. 118 and sotalol hydrochloride p. 85) are less likely to enter the brain and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Some beta-blockers, such as atenolol, have an intrinsically longer duration of action and need to be given only once daily. Carvedilol p. 139 and labetalol hydrochloride p. 115 are beta-blockers which have, in addition, an arteriolar vasodilating action and thus lower peripheral resistance. Although carvedilol and labetalol hydrochloride possess both alpha- and beta-blocking properties, these drugs have no important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in children with second- or third-degree heart block.

Beta-blockers can precipitate asthma and should usually be avoided in children with a history of asthma or bronchospasm. If there is no alternative, a child with well-controlled asthma can be treated for a co-existing condition (e.g. arrhythmia) with a cardioselective beta-blocker, which should be initiated with caution at a low dose by a specialist and the child monitored closely for adverse effects. Atenolol and metoprolol tartrate p. 119 have less effect on the $beta_2$ (bronchial) receptors and are, therefore, relatively *cardioselective*, but they are not *cardiospecific*; they have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities, and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism causing hypoglycaemia or hyperglycaemia in children with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers (e.g. atenolol and metoprolol tartrate) may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia.

Hypertension

Beta-blockers are effective for reducing blood pressure, but their mode of action is not understood; they reduce cardiac output, alter baroceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action. Blood pressure can usually be controlled with relatively few side-effects. In general the dose of beta-blocker does not have to be high.

Labetalol hydrochloride may be given intravenously for *hypertensive emergencies* in children; however, care is needed to avoid dangerous hypotension or beta-blockade, particularly in neonates. Esmolol hydrochloride p. 119 is also used intravenously for the treatment of hypertension particularly in the peri-operative period.

Beta-blockers can be used to control the pulse rate in children with *phaeochromocytoma*. However, they should

never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis; phenoxybenzamine hydrochloride p. 130 should always be used together with the beta-blocker.

Arrhythmias

In arrhythmias, beta-blockers act principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used alone or in conjunction with digoxin p. 86 to control the ventricular rate in *atrial fibrillation*. Beta-blockers are also useful in the management of *supraventricular tachycardias* and *ventricular tachycardias* particularly to prevent recurrence of the tachycardia.

Esmolol hydrochloride is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias and sinus tachycardia, particularly in the peri-operative period.

Sotalol hydrochloride is a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity. Atenolol and sotalol hydrochloride suppress ventricular ectopic beats and non-sustained ventricular tachycardia. However, the pro-arrhythmic effects of sotalol hydrochloride, particularly in children with sick sinus syndrome, may prolong the QT interval and induce torsade de pointes.

Heart failure

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity and the addition of a beta-blocker such as carvedilol to other treatment for heart failure may be beneficial. Treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis

Beta-blockers are used in the management of *thyrotoxicosis* including neonatal thyrotoxicosis; propranolol hydrochloride p. 116 can reverse clinical symptoms within 4 days. Beta-blockers are also used for the pre-operative preparation for thyroidectomy; the thyroid gland is rendered less vascular, thus facilitating surgery.

Other uses

In tetralogy of Fallot, esmolol hydrochloride or propranolol hydrochloride may be given intravenously in the initial management of *cyanotic spells*; propranolol hydrochloride is given by mouth for preventing cyanotic spells. If a severe cyanotic spell in a child with congenital heart disease persists despite optimal use of 100% oxygen, propranolol hydrochloride is given by intravenous infusion. If cyanosis is still present after 10 minutes, sodium bicarbonate intravenous infusion p. 669 is given in a dose to correct acidosis (or dose calculated according to arterial blood gas results); sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year. If blood-glucose concentration is less than 3 mmol/litre, glucose 10% intravenous infusion is given, followed by intravenous or intramuscular injection of morphine p. 315.

Beta-blockers are also used in the *prophylaxis of migraine*. Betaxolol p. 774, levobunolol hydrochloride p. 774, and timolol maleate p. 775 are used topically in *glaucoma*.

Beta-adrenoceptor blockers (systemic)

- **CONTRA-INDICATIONS** Asthma · cardiogenic shock · hypotension · marked bradycardia · metabolic acidosis · phaeochromocytoma (apart from specific use with alpha-blockers) · second-degree AV block · severe peripheral arterial disease · sick sinus syndrome · third-degree AV block · uncontrolled heart failure

CONTRA-INDICATIONS, FURTHER INFORMATION

- Bronchospasm Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

- **CAUTIONS** Diabetes · first-degree AV block · history of obstructive airways disease (introduce cautiously) · myasthenia gravis · portal hypertension (risk of deterioration in liver function) · psoriasis · symptoms of thyrotoxicosis may be masked

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort · bradycardia · confusion · depression · diarrhoea · dizziness · dry eye (reversible on discontinuation) · dyspnoea · erectile dysfunction · fatigue · headache · heart failure · nausea · paraesthesia · peripheral coldness · peripheral vascular disease · rash (reversible on discontinuation) · sleep disorders · syncope · visual impairment · vomiting
  - **Uncommon** Atrioventricular block · bronchospasm
  - **Rare or very rare** Hallucination

SIDE-EFFECTS, FURTHER INFORMATION With administration by intravenous injection, excessive bradycardia can occur and may be countered with **intravenous injection** of atropine sulfate.

Overdose Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 944.

- **ALLERGY AND CROSS-SENSITIVITY** EvGr Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Ⓜ Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).
- **PREGNANCY** Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.
- **BREAST FEEDING** With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.
- **MONITORING REQUIREMENTS** Monitor lung function (in patients with a history of obstructive airway disease).
- **TREATMENT CESSATION** Avoid abrupt withdrawal.

BETA-ADRENOCEPTOR BLOCKERS › ALPHA- AND BETA-ADRENOCEPTOR BLOCKERS

above

Labetalol hydrochloride

13-May-2021

- **INDICATIONS AND DOSE**

Hypertensive emergencies

- BY INTRAVENOUS INFUSION

- Neonate: Initially 0.5 mg/kg/hour (max. per dose 4 mg/kg/hour), dose to be adjusted according to response at intervals of at least 15 minutes.

continued →

- Child 1 month–11 years: Initially 0.5–1 mg/kg/hour (max. per dose 3 mg/kg/hour), dose to be adjusted according to response at intervals of at least 15 minutes
- Child 12–17 years: Initially 30–120 mg/hour, dose to be adjusted according to response at intervals of at least 15 minutes

Hypertension

- BY MOUTH
- Child 1 month–11 years: 1–2 mg/kg 3–4 times a day
- Child 12–17 years: Initially 50–100 mg twice daily, dose to be increased if required at intervals of 3–14 days; usual dose 200–400 mg twice daily, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
- BY INTRAVENOUS INJECTION
- Child 1 month–11 years: 250–500 micrograms/kg (max. per dose 20 mg) for 1 dose
- Child 12–17 years: 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course

● **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

- With intravenous use

Consult local guidelines. In hypertensive encephalopathy reduce blood pressure to normotensive level over 24–48 hours (more rapid reduction may lead to cerebral infarction, blindness, and death). If child fitting, reduce blood pressure rapidly, but not to normal levels.

● **CAUTIONS** Liver damage

● **INTERACTIONS** → Appendix 1: beta blockers, non-selective

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Drug fever · ejaculation failure · hypersensitivity · urinary disorders
- **Rare or very rare** Hepatic disorders · systemic lupus erythematosus (SLE) · toxic myopathy · tremor
- **Frequency not known** Alopecia · cyanosis · hyperhidrosis · hyperkalaemia · interstitial lung disease · lethargy · muscle cramps · nasal congestion · peripheral oedema · postural hypotension · psychosis · skin reactions · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- With intravenous use Fever · hypoglycaemia masked · thyrotoxicosis masked
- With oral use Photosensitivity reaction

● **PREGNANCY** The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta blockade).

● **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of slow metabolism).
Dose adjustments In adults, manufacturer advises consider dose reduction.

● **RENAL IMPAIRMENT**
Dose adjustments In adults, manufacturer advises consider dose reduction.

● **MONITORING REQUIREMENTS**

- Liver damage Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.

● **EFFECT ON LABORATORY TESTS** Interferes with laboratory tests for catecholamines.

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use EvGr For *intravenous infusion*, dilute to a concentration of 1 mg/mL in Glucose 5% or Sodium Chloride and Glucose 5%; Ⓜ expert sources advise if fluid restricted may be given undiluted, preferably through a central venous catheter. EvGr Avoid upright position during and for 3 hours after intravenous administration. Ⓜ
- With oral use For administration *by mouth*, expert sources advise injection may be given orally with squash or juice.

BETA-ADRENOCEPTOR BLOCKERS › NON-SELECTIVE

115

Propranolol hydrochloride

05-May-2021

● **INDICATIONS AND DOSE**

Hyperthyroidism with autonomic symptoms

- BY MOUTH
- Neonate: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response.
- Child: Initially 250–500 micrograms/kg every 8 hours, adjusted according to response; increased if necessary up to 1 mg/kg every 8 hours (max. per dose 40 mg every 8 hours)
- BY INTRAVENOUS INJECTION
- Neonate: Initially 20–50 micrograms/kg every 6–8 hours, adjusted according to response, to be given over 10 minutes.
- Child: Initially 25–50 micrograms/kg every 6–8 hours (max. per dose 5 mg), adjusted according to response, to be given over 10 minutes

Thyrotoxicosis (adjunct)

▸ BY MOUTH

- Neonate: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response.
- Child: Initially 250–500 micrograms/kg every 8 hours, adjusted according to response; increased if necessary up to 1 mg/kg every 8 hours (max. per dose 40 mg every 8 hours)

▸ BY INTRAVENOUS INJECTION

- Neonate: Initially 20–50 micrograms/kg every 6–8 hours, adjusted according to response, to be given over 10 minutes.
- Child: Initially 25–50 micrograms/kg every 6–8 hours (max. per dose 5 mg), adjusted according to response, to be given over 10 minutes

Thyrotoxic crisis

▸ BY MOUTH

- Neonate: Initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response.
- Child: Initially 250–500 micrograms/kg every 8 hours, adjusted according to response; increased if necessary up to 1 mg/kg every 8 hours (max. per dose 40 mg every 8 hours)

▸ BY INTRAVENOUS INJECTION

- Neonate: Initially 20–50 micrograms/kg every 6–8 hours, adjusted according to response, to be given over 10 minutes.
- Child: Initially 25–50 micrograms/kg every 6–8 hours (max. per dose 5 mg), adjusted according to response, to be given over 10 minutes

Hypertension

▸ BY MOUTH

- Neonate: Initially 250 micrograms/kg 3 times a day, then increased if necessary up to 2 mg/kg 3 times a day.
- Child 1 month-11 years: Initially 0.25–1 mg/kg 3 times a day, then increased to 5 mg/kg daily in divided doses, dose should be increased at weekly intervals
- Child 12-17 years: Initially 80 mg twice daily, then increased if necessary up to 160–320 mg daily, dose should be increased at weekly intervals, slow-release preparations may be used for once daily administration

Migraine prophylaxis

▸ BY MOUTH

- Child 2-11 years: Initially 200–500 micrograms/kg twice daily; usual dose 10–20 mg twice daily (max. per dose 2 mg/kg twice daily)
- Child 12-17 years: Initially 20–40 mg twice daily; usual dose 40–80 mg twice daily (max. per dose 120 mg); maximum 4 mg/kg per day

Arrhythmias

▸ BY MOUTH

- Neonate: 250–500 micrograms/kg 3 times a day, adjusted according to response.
- Child: 250–500 micrograms/kg 3–4 times a day (max. per dose 1 mg/kg 4 times a day), adjusted according to response; maximum 160 mg per day

▸ BY SLOW INTRAVENOUS INJECTION

- Neonate: 20–50 micrograms/kg, then 20–50 micrograms/kg every 6–8 hours if required, eCG monitoring required.
- Child: 25–50 micrograms/kg, then 25–50 micrograms/kg every 6–8 hours if required, eCG monitoring required

Tetralogy of Fallot

▸ BY MOUTH

- Neonate: 0.25–1 mg/kg 2–3 times a day (max. per dose 2 mg/kg 3 times a day).
- Child 1 month-11 years: 0.25–1 mg/kg 3–4 times a day, maximum dose to be given in divided doses; maximum 5 mg/kg per day

▸ BY SLOW INTRAVENOUS INJECTION

- Neonate: Initially 15–20 micrograms/kg (max. per dose 100 micrograms/kg), then 15–20 micrograms/kg every 12 hours if required, eCG monitoring is required with administration.
- Child 1 month-11 years: Initially 15–20 micrograms/kg (max. per dose 100 micrograms/kg), higher doses are rarely necessary, then 15–20 micrograms/kg every 6–8 hours if required, eCG monitoring is required with administration

Infantile haemangioma [proliferating, with ulceration, risk of disfigurement, or functional impairment] (initiated under specialist supervision)

▸ BY MOUTH

- Child: Initially 1 mg/kg daily in 3 divided doses, to be increased after at least 24 hours, usual maintenance 2 mg/kg daily in 2–3 divided doses, dosing to be given using 5mg/5mL oral solution. Review treatment after 2–3 months and adjust dosing for weight gain. Most patients do not need treatment beyond 17 months of age, for neonates, preterm infants, patients with comorbidities, or those with segmental infantile haemangioma and suspected PHACES syndrome, reduced dosing is required, as determined by the supervising specialist; maximum 3 mg/kg per day

● **UNLICENSED USE** Not licensed for treatment of hypertension in children under 12 years.

▸ With oral use EvGr Propranolol hydrochloride is used for the treatment of infantile haemangioma A, but is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Propranolol has been confused with prednisolone; care must be taken to ensure the correct drug is prescribed and dispensed.

● **CONTRA-INDICATIONS**

▸ When used for infantile haemangioma Hypoglycaemic episodes (recent or ongoing; interrupt treatment if significantly reduced oral intake)

● **INTERACTIONS** → Appendix 1: beta blockers, non-selective

● **SIDE-EFFECTS**

▸ **Rare or very rare** Alopecia · memory loss · mood altered · neuromuscular dysfunction · postural hypotension · psychosis · skin reactions · thrombocytopenia

▸ **Frequency not known** Hypoglycaemia

Overdose Severe overdosages with propranolol may cause cardiovascular collapse, CNS depression, and convulsions.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic encephalopathy; risk of increased half-life).

Dose adjustments ▸ With oral use Manufacturer advises consider dose reduction.

● **RENAL IMPAIRMENT** EvGr Use with caution (risk of increased half-life). M

Dose adjustments EvGr Consider dose reduction. M

● **TREATMENT CESSATION**

▸ When used for Infantile haemangioma EvGr Treatment can be stopped abruptly during or at the end of therapy. A

- **DIRECTIONS FOR ADMINISTRATION** For *slow intravenous injection*, expert sources advise give over at least 3–5 minutes; may be diluted with Sodium Chloride 0.9% or Glucose 5%; incompatible with bicarbonate. Manufacturer advises rate of administration should not exceed 1 mg/minute.
- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations can be used for once daily administration.
- **PATIENT AND CARER ADVICE**
  - When used for Infantile haemangioma Parents and carers should be provided with a drug dosing card to record dose adjustments, and a patient information leaflet such as that produced by the British Association of Dermatologists. tinyurl.com/yhb3ecr9

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

CALCIUM-CHANNEL BLOCKERS

Calcium-channel blockers

Overview

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 122, diltiazem hydrochloride p. 158, and the dihydropyridine calcium-channel blockers (amlodipine below, nicardipine hydrochloride p. 121, nifedipine p. 121, and nimodipine p. 93). Verapamil hydrochloride and diltiazem hydrochloride should usually be **avoided** in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil hydrochloride is used for the treatment of hypertension and arrhythmias. However, it is no longer first-line treatment for arrhythmias in children because it has been associated with fatal collapse especially in infants under 1 year; adenosine p. 85 is now recommended for first-line use.

Verapamil hydrochloride is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should **not** be used with beta-blockers. Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine may be used if a modified-release preparation delivering the appropriate dose is not available or if a child is unable to swallow (a liquid preparation may be prepared using capsules). Nifedipine may also be used for the management of angina due to coronary artery disease in Kawasaki disease or progeria and in the management of Raynaud's syndrome.

Nicardipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility; it should only be used for the treatment of life-threatening hypertension in paediatric intensive care settings and in postoperative hypertension.

Amlodipine also resembles nifedipine and nicardipine hydrochloride in its effects and does not reduce myocardial contractility or produce clinical deterioration in heart failure. It has a longer duration of action and can be given once daily. Nifedipine and amlodipine are used for the treatment of hypertension. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is a peripheral vasodilator and also has mild depressor effects on the myocardium. It is used in the treatment of Raynaud's syndrome.

Calcium-channel blockers

- **DRUG ACTION** Calcium-channel blockers (less correctly called 'calcium-antagonists') interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · dizziness · drowsiness · flushing · headache · nausea · palpitations · peripheral oedema · skin reactions · tachycardia · vomiting
  - **Uncommon** Angioedema · depression · erectile dysfunction · gingival hyperplasia · myalgia · paraesthesia · syncope

  Overdose Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation. For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (risk of increased exposure).
- **TREATMENT CESSATION** There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

F above

Amlodipine

03-Mar-2022

- **DRUG ACTION** Amlodipine is a dihydropyridine calcium-channel blocker.
- **INDICATIONS AND DOSE**

Hypertension

- BY MOUTH
  - Child 1 month–11 years: Initially 100–200 micrograms/kg once daily; increased if necessary up to 400 micrograms/kg once daily, adjusted at intervals of 1–2 weeks; maximum 10 mg per day
  - Child 12–17 years: Initially 5 mg once daily; increased if necessary up to 10 mg once daily, adjusted at intervals of 1–2 weeks

DOSE EQUIVALENCE AND CONVERSION

- Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

- **UNLICENSED USE** Not licensed for use in children under 6 years.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Amlodipine has been confused with nimodipine and atenolol; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Cardiogenic shock · significant aortic stenosis · unstable angina
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
  - **Common or very common** Asthenia · constipation · diarrhoea · dyspepsia · dyspnoea · gastrointestinal disorders · joint disorders · muscle cramps · oedema · vision disorders
  - **Uncommon** Alopecia · anxiety · arrhythmias · chest pain · cough · dry mouth · gynaecomastia · hyperhidrosis · hypotension · insomnia · malaise · mood altered ·

numbness · pain · rhinitis · taste altered · tinnitus · tremor · urinary disorders · weight changes

▸ **Rare or very rare** Confusion · hepatic disorders · hyperglycaemia · hypersensitivity · leucopenia · muscle tone increased · myocardial infarction · pancreatitis · peripheral neuropathy · photosensitivity reaction · Stevens-Johnson syndrome · thrombocytopenia · vasculitis

▸ **Frequency not known** Extrapyramidal symptoms · pulmonary oedema

- **PREGNANCY** No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**
  Dose adjustments Manufacturer advises initiate at low dose and titrate slowly (limited information available).
- **DIRECTIONS FOR ADMINISTRATION** Expert sources advise tablets may be dispersed in water.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Amlodipine for high blood pressure www.medicinesforchildren.org.uk/medicines/amlodipine-for-high-blood-pressure/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

▸ **Amlodipine (Non-proprietary)**
Amlodipine 1 mg per 1 ml Amlodipine 5mg/5ml oral solution sugar free sugar-free | 150 ml PoM £75.78 DT = £75.78
Amlodipine 2 mg per 1 ml Amlodipine 10mg/5ml oral solution sugar free sugar-free | 150 ml PoM £115.73 DT = £115.73

Oral suspension

▸ **Amlodipine (Non-proprietary)**
Amlodipine 1 mg per 1 ml Amlodipine 5mg/5ml oral suspension sugar free sugar-free | 150 ml PoM £70.00 DT = £70.00

Tablet

▸ **Amlodipine (Non-proprietary)**
Amlodipine 2.5 mg Amlodipine 2.5mg tablets | 28 tablet PoM £8.72 DT = £7.87
Amlodipine 5 mg Amlodipine 5mg tablets | 28 tablet PoM £9.99 DT = £0.74 | 500 tablet PoM £9.82–£15.17
Amlodipine 10 mg Amlodipine 10mg tablets | 28 tablet PoM £14.07 DT = £0.76 | 500 tablet PoM £10.17–£21.48

▸ **Istin** (Viatris UK Healthcare Ltd)
Amlodipine 5 mg Istin 5mg tablets | 28 tablet PoM £11.08 DT = £0.74
Amlodipine 10 mg Istin 10mg tablets | 28 tablet PoM £16.55 DT = £0.76

120

Nicardipine hydrochloride

04-Jan-2022

- **DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

- **INDICATIONS AND DOSE**

Life-threatening hypertension (specialist use only) | Post-operative hypertension (specialist use only)

▸ BY CONTINUOUS INTRAVENOUS INFUSION

▸ Neonate: Initially 500 nanograms/kg/minute (max. per dose 5 micrograms/kg/minute), adjusted according to response; maintenance 1–4 micrograms/kg/minute.

▸ Child: Initially 500 nanograms/kg/minute (max. per dose 5 micrograms/kg/minute), adjusted according to response; maintenance 1–4 micrograms/kg/minute (max. per dose 250 micrograms/minute)

- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · avoid within 8 days of myocardial infarction · cardiogenic shock · compensatory hypertension · significant or advanced aortic stenosis · unstable or acute attacks of angina
- **CAUTIONS** Congestive heart failure · elevated intracranial pressure · increased risk of serious hypotension · ischaemic heart disease · portal hypertension · pulmonary oedema · significantly impaired left ventricular function · stroke
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**

▸ **Common or very common** Hypotension

▸ **Frequency not known** Atrioventricular block · hepatic disorders · ischaemic heart disease · paralytic ileus · pulmonary oedema · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur — during intravenous use consider stopping infusion or decreasing dose by half.

- **PREGNANCY** May inhibit labour. Not to be used in multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in *animal* studies. Risk of severe maternal hypotension and fatal fetal hypoxia—avoid excessive decrease in blood pressure.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT**
  Dose adjustments In adults, manufacturer advises dose reduction—consult product literature.
- **RENAL IMPAIRMENT** EvGr Caution (increased risk of serious hypotension). M
  Dose adjustments EvGr Use lowest dose. M
- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored.

  For *continuous intravenous infusion*, manufacturer advises dilute to a concentration of 100–200 micrograms/mL with Glucose 5% and give *via* volumetric infusion pump or syringe driver; protect from light; risk of adsorption on to plastic in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product literature. To minimise peripheral venous irritation, expert sources advise change site of infusion every 12 hours.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▸ **Nicardipine hydrochloride (Non-proprietary)**
Nicardipine hydrochloride 1 mg per 1 ml Nicardipine 10mg/10ml solution for infusion ampoules | 5 ampoule PoM £90.00 (Hospital only)
Nicardipine hydrochloride 2.5 mg per 1 ml Cardene I.V. 25mg/10ml solution for infusion ampoules | 10 ampoule PoM ⊘ (Hospital only)

120

Nifedipine

24-Jul-2020

- **INDICATIONS AND DOSE**

Hypertensive crisis | Acute angina in Kawasaki disease or progeria

▸ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▸ Child: Initially 250–500 micrograms/kg (max. per dose 10 mg), then repeat once if necessary, may cause unpredictable and severe reduction of blood pressure—monitor closely following administration; if ineffective consider alternative treatment and seek specialist advice

continued →

Hypertension | Angina in Kawasaki disease or progeria

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 1 month–11 years: 200–300 micrograms/kg 3 times a day, dose frequency depends on preparation used; maximum 3 mg/kg per day; maximum 90 mg per day
- Child 12–17 years: 5–20 mg 3 times a day, dose frequency depends on preparation used; maximum 90 mg per day

Raynaud's syndrome

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 2–17 years: 2.5–10 mg 2–4 times a day, start with low doses at night and increase gradually to avoid postural hypotension, dose frequency depends on preparation used

Persistent hyperinsulinaemic hypoglycaemia

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Neonate: 100–200 micrograms/kg 4 times a day (max. per dose 600 micrograms/kg).

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Cardiogenic shock · significant aortic stenosis · within 1 month of myocardial infarction
- **CAUTIONS** Diabetes mellitus · heart failure · poor cardiac reserve · severe hypotension · short-acting formulations are not recommended for angina or long-term management of hypertension (their use may be associated with large variations in blood pressure and reflex tachycardia) · significantly impaired left ventricular function (heart failure deterioration observed)
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
  - **Common or very common** Constipation · malaise · oedema · vasodilation
  - **Uncommon** Allergic oedema · anxiety · chills · diarrhoea · dry mouth · epistaxis · gastrointestinal discomfort · gastrointestinal disorders · hypotension · joint disorders · laryngeal oedema · migraine · muscle complaints · nasal congestion · pain · sleep disorders · tremor · urinary disorders · vertigo · vision disorders
  - **Rare or very rare** Appetite decreased · burping · cardiovascular disorder · fever · hyperhidrosis · mood altered · sensation abnormal
  - **Frequency not known** Agranulocytosis · bezoar · cerebral ischaemia · chest pain · dysphagia · dyspnoea · eye pain · gingival disorder · gynaecomastia (following long term use) · hepatic disorders · hyperglycaemia · ischaemic heart disease · leucopenia · myasthenia gravis aggravated · photoallergic reaction · pulmonary oedema · telangiectasia · toxic epidermal necrolysis · weight decreased
- **PREGNANCY** May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.
- **BREAST FEEDING** Amount too small to be harmful but manufacturers advise avoid.
- **HEPATIC IMPAIRMENT**
  Dose adjustments In adults, manufacturer advises consider dose reduction—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** For rapid effect in *hypertensive crisis* or *acute angina*, bite capsules and swallow liquid or use liquid preparation if 5 mg or 10 mg dose inappropriate. If liquid unavailable, extract contents of capsule via a syringe and use immediately—cover syringe with foil to protect contents from light; capsule contents may be diluted with water if necessary.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Nifedipine for high blood pressure www.medicinesforchildren.org.uk/medicines/nifedipine-for-high-blood-pressure/
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral drops

Oral drops

- **Nifedipine (Non-proprietary)**
  Nifedipine 20 mg per 1 ml Nifedipin-ratiopharm 20mg/ml oral drops | 30 ml PoM DT = £208.04

Capsule

- **Nifedipine (Non-proprietary)**
  Nifedipine 5 mg Nifedipine 5mg capsules | 90 capsule PoM £70.91 DT = £51.95
  Nifedipine 10 mg Nifedipine 10mg capsules | 90 capsule PoM £89.57 DT = £65.63

120

Verapamil hydrochloride

17-Jul-2020

- **INDICATIONS AND DOSE**

Treatment of supraventricular arrhythmias

- BY SLOW INTRAVENOUS INJECTION
- Child 1–17 years (administered on expert advice): 100–300 micrograms/kg (max. per dose 5 mg) for 1 dose, to be given over 2–3 minutes (with ECG and blood-pressure monitoring), dose can be repeated after 30 minutes if necessary

Hypertension

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–23 months (administered on expert advice): 20 mg 2–3 times a day
- Child 2–17 years (administered on expert advice): 40–120 mg 2–3 times a day

Prophylaxis of supraventricular arrhythmias (administered on expert advice)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–23 months: 20 mg 2–3 times a day
- Child 2–17 years: 40–120 mg 2–3 times a day

- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) · bradycardia · cardiogenic shock · heart failure (with reduced ejection fraction) · history of significantly impaired left ventricular function (even if controlled by therapy) · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block
- **CAUTIONS** Acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure) · first-degree AV block · neuromuscular disorders
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

  - **Common or very common** Hypotension
  - **Frequency not known** Atrioventricular block · extrapyramidal symptoms · Stevens-Johnson syndrome · vertigo

SPECIFIC SIDE-EFFECTS

  - **Common or very common**
    - With intravenous use Bradycardia
  - **Frequency not known**
    - With intravenous use Cardiac arrest · hepatic impairment · hyperhidrosis · myocardial contractility decreased · nervousness · seizure
    - With oral use Abdominal discomfort · alopecia · arrhythmias · arthralgia · constipation · erythromelalgia · fatigue · galactorrhoea · heart failure · ileus · muscle weakness · tinnitus · tremor

Overdose In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- **PREGNANCY** May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT**
  Dose adjustments ▸ With oral use Manufacturer advises dose reduction.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, expert sources advise may be diluted with Glucose 5% *or* Sodium Chloride 0.9%. Incompatible with solutions of pH greater than 6.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▸ **Verapamil hydrochloride (Non-proprietary)**
Verapamil hydrochloride 40 mg Verapamil 40mg tablets | 84 tablet PoM £2.15 DT = £1.48
Verapamil hydrochloride 80 mg Verapamil 80mg tablets | 84 tablet PoM £2.88 DT = £2.15
Verapamil hydrochloride 120 mg Verapamil 120mg tablets | 28 tablet PoM £3.25 DT = £2.91
Verapamil hydrochloride 160 mg Verapamil 160mg tablets | 56 tablet PoM £39.41 DT = £31.53

Solution for injection

▸ **Securon** (Viatris UK Healthcare Ltd)
Verapamil hydrochloride 2.5 mg per 1 ml Securon IV 5mg/2ml solution for injection ampoules | 5 ampoule PoM £5.41

Oral solution

▸ **Verapamil hydrochloride (Non-proprietary)**
Verapamil hydrochloride 8 mg per 1 ml Verapamil 40mg/5ml oral solution sugar free sugar-free | 150 ml PoM £158.85 DT = £158.85

DIURETICS › THIAZIDES AND RELATED DIURETICS

Thiazides and related diuretics

- **CONTRA-INDICATIONS** Addison's disease · hypercalcaemia · hyponatraemia · refractory hypokalaemia · symptomatic hyperuricaemia
- **CAUTIONS** Diabetes · gout · risk of hypokalaemia · systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

▸ **Existing conditions** Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

▸ **Potassium loss** Hypokalaemia can occur with thiazides and related diuretics.

Hypokalaemia is particularly dangerous in children being treated with cardiac glycosides. In hepatic impairment, hypokalaemia caused by diuretics can precipitate encephalopathy.

The use of potassium-sparing diuretics avoids the need to take potassium supplements.

- **SIDE-EFFECTS**

▸ **Common or very common** Alkalosis hypochloraemic · constipation · diarrhoea · dizziness · electrolyte imbalance · erectile dysfunction · fatigue · headache · hyperglycaemia · hyperuricaemia · nausea · postural hypotension · skin reactions · vomiting

▸ **Uncommon** Agranulocytosis · aplastic anaemia · leucopenia · pancreatitis · photosensitivity reaction · thrombocytopenia

▸ **Rare or very rare** Paraesthesia

- **PREGNANCY** Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.
- **HEPATIC IMPAIRMENT** In general, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment (risk of electrolyte imbalance and reduced renal function); avoid in severe impairment (ineffective if creatinine clearance less than 30 mL/minute). See p. 15.
- **MONITORING REQUIREMENTS** Electrolytes should be monitored, particularly with high doses and long-term use.

above

Bendroflumethiazide

(Bendrofluazide)

- **INDICATIONS AND DOSE**

Hypertension

▸ BY MOUTH

▸ Child 1 month–1 year: 50–100 micrograms/kg daily, adjusted according to response

▸ Child 2–11 years: Initially 50–400 micrograms/kg daily (max. per dose 10 mg), then maintenance 50–100 micrograms/kg daily, adjusted according to response; maximum 10 mg per day

▸ Child 12–17 years: 2.5 mg once daily, dose to be taken as a single dose in the morning, higher doses are rarely necessary

Oedema in heart failure, renal disease and hepatic disease | Pulmonary oedema

▸ BY MOUTH

▸ Child 1 month–1 year: 50–100 micrograms/kg daily, adjusted according to response

▸ Child 2–11 years: Initially 50–400 micrograms/kg daily (max. per dose 10 mg), then maintenance 50–100 micrograms/kg daily, adjusted according to response; maximum 10 mg per day

▸ Child 12–17 years: Initially 5–10 mg once daily or on alternate days, adjusted according to response, dose to be taken as a single dose in the morning; maximum 10 mg per day

- **INTERACTIONS** → Appendix 1: thiazide diuretics
- **SIDE-EFFECTS** Blood disorder · cholestasis · gastrointestinal disorder · gout · neutropenia · pneumonitis · pulmonary oedema · severe cutaneous adverse reactions (SCARs)
- **BREAST FEEDING** The amount present in milk is too small to be harmful. Large doses may suppress lactation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▸ **Bendroflumethiazide (Non-proprietary)**
Bendroflumethiazide 2.5 mg Bendroflumethiazide 2.5mg tablets | 28 tablet PoM £0.73 DT = £0.73 | 500 tablet PoM £12.00
Bendroflumethiazide 5 mg Bendroflumethiazide 5mg tablets | 28 tablet PoM £0.98 DT = £0.89

F 123

Chlorothiazide

23-Sep-2020

● **INDICATIONS AND DOSE**

Heart failure | Hypertension | Ascites

▸ BY MOUTH

▸ Neonate: 10–20 mg/kg twice daily.

▸ Child 1-5 months: 10–20 mg/kg twice daily

▸ Child 6 months-11 years: 10 mg/kg twice daily; maximum 1 g per day

▸ Child 12-17 years: 0.25–1 g once daily, alternatively 125–500 mg twice daily

Reduction of diazoxide-induced sodium and water retention in the management of chronic hypoglycaemia | Potentiating the glyacaemic effect of diazoxide in the management of chronic hypoglycaemia

▸ BY MOUTH

▸ Child: 3–5 mg/kg twice daily

Nephrogenic and partial pituitary diabetes insipidus

▸ BY MOUTH

▸ Child: 10–20 mg/kg twice daily (max. per dose 500 mg)

● **UNLICENSED USE** Not licensed.

● **CAUTIONS** Neonate (theoretical risk of kernicterus if very jaundiced)

● **INTERACTIONS** → Appendix 1: thiazide diuretics

● **BREAST FEEDING** The amount present in milk is too small to be harmful. Large doses may suppress lactation.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Tablet

▸ Chlorothiazide (Non-proprietary)

Chlorothiazide 250 mg Diuril 250mg tablets | 100 tablet PoM

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM › ACE INHIBITORS

Angiotensin-converting enzyme inhibitors

● **CONTRA-INDICATIONS** Bilateral renovascular disease · hereditary or idiopathic angioedema · history of angioedema associated with prior ACE inhibitor therapy

● **CAUTIONS** Concomitant diuretics · diabetes (may lower blood glucose; increased risk of hyperkalaemia) · first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with cerebrovascular disease, ischaemic heart disease, or heart failure) · neonates · patients of black African or African-Caribbean origin (may respond less well to ACE inhibitors) · primary aldosteronism (patients may respond less well to ACE inhibitors) · the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) · use with care in patients with aortic or mitral valve stenosis (risk of hypotension) · use with care in patients with hypertrophic cardiomyopathy

CAUTIONS, FURTHER INFORMATION

▸ Anaphylactoid reactions EvGr To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux membranes (e.g. polyacrylonitrile) and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wasp or bee venom. M

● **SIDE-EFFECTS**

▸ **Common or very common** Alopecia · angina pectoris · angioedema (can be delayed; more common in black patients) · arrhythmias · asthenia · chest pain · constipation · cough · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hypotension · myalgia · nausea · palpitations · paraesthesia · renal impairment · rhinitis · skin reactions · sleep disorder · syncope · taste altered · tinnitus · vertigo · vomiting

▸ **Uncommon** Arthralgia · confusion · eosinophilia · erectile dysfunction · fever · haemolytic anaemia · hyperhidrosis · myocardial infarction · pancreatitis · peripheral oedema · photosensitivity reaction · respiratory disorders · stroke

▸ **Rare or very rare** Agranulocytosis · hepatitis · leucopenia · neutropenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

● **ALLERGY AND CROSS-SENSITIVITY** EvGr ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema). M

● **PREGNANCY** ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

● **BREAST FEEDING** Information on the use of ACE inhibitors in breast-feeding is limited.

● **RENAL IMPAIRMENT** EvGr Caution (hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function).

Dose adjustments Start with low dose and adjust according to response. M

● **MONITORING REQUIREMENTS** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).

● **DIRECTIONS FOR ADMINISTRATION** For hypertension the first dose should preferably be given at bedtime.

F above

Captopril

08-Jun-2021

● **INDICATIONS AND DOSE**

Hypertension

▸ BY MOUTH

▸ Preterm neonate (initiated under specialist supervision): Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

▸ Neonate (initiated under specialist supervision): Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

▸ Child 1-11 months (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated

- Child 1-11 years (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 6 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated
- Child 12-17 years (initiated under specialist supervision): Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, then increased if necessary up to 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated

Heart failure

- BY MOUTH

- Preterm neonate (initiated under specialist supervision): Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Neonate (initiated under specialist supervision): Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 months (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated
- Child 1-11 years (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 6 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated
- Child 12-17 years (initiated under specialist supervision): Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, then increased if necessary up to 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated

Proteinuria in nephritis (under expert supervision)

- BY MOUTH

- Preterm neonate: Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Neonate: Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 months: Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated
- Child 1-11 years: Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 6 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated
- Child 12-17 years: Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, then increased if necessary up to 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated

Diabetic nephropathy in type 1 diabetes mellitus

- BY MOUTH

- Child 12-17 years (under expert supervision): Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1– 2 hours; usual dose 12.5–25 mg 2–3 times a day, increased if necessary up to 100 mg daily in divided doses, ongoing doses should only be given if test dose tolerated

- **UNLICENSED USE** Not licensed for proteinuria in nephritis. Captopril doses in BNF Publications differ from product licence.
- **CAUTIONS** Children (efficacy and safety not fully established)
- **INTERACTIONS** → Appendix 1: ACE inhibitors
- **SIDE-EFFECTS**
  - **Common or very common** Insomnia · peptic ulcer
  - **Uncommon** Appetite decreased · flushing · malaise · pallor · Raynaud's phenomenon
  - **Rare or very rare** Anaemia · aplastic anaemia · autoimmune disorder · cardiac arrest · cardiogenic shock · cerebrovascular insufficiency · depression · gynaecomastia · hepatic disorders · hypoglycaemia · lymphadenopathy · nephrotic syndrome · oral disorders · proteinuria · urinary disorders · vision blurred
- **BREAST FEEDING** Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.
- **DIRECTIONS FOR ADMINISTRATION** Administer under close supervision. Expert sources advise give test dose whilst child supine. Tablets can be dispersed in water.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Captopril for heart failure
  www.medicinesforchildren.org.uk/medicines/captopril-for-heart-failure/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

- **Captopril (Non-proprietary)**
  Captopril 12.5 mg Captopril 12.5mg tablets | 56 tablet PoM £1.88 DT = £1.88
  Captopril 25 mg Captopril 25mg tablets | 56 tablet PoM £1.99 DT = £1.87
  Captopril 50 mg Captopril 50mg tablets | 56 tablet PoM £1.88 DT = £1.72

Oral solution

ELECTROLYTES: May contain Sodium

- **Captopril (Non-proprietary)**
  Captopril 1 mg per 1 ml Captopril 5mg/5ml oral solution sugar free sugar-free | 100 ml PoM £98.21 DT = £93.33
  Captopril 5 mg per 1 ml Captopril 25mg/5ml oral solution sugar free sugar-free | 100 ml PoM £108.94 DT = £103.51
- **Noyada** (Martindale Pharmaceuticals Ltd)
  Captopril 1 mg per 1 ml Noyada 5mg/5ml oral solution sugar-free | 100 ml PoM £98.21 DT = £93.33

Captopril 5 mg per 1 ml Noyada 25mg/5ml oral solution sugar-free | 100 ml PoM £108.94 DT = £103.51

F 124

Enalapril maleate

08-Jun-2021

● **INDICATIONS AND DOSE**

Hypertension

► BY MOUTH

- Neonate (under expert supervision): Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.
- Child 1 month-11 years (under expert supervision): Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, then increased if necessary up to 1 mg/kg daily in 1–2 divided doses
- Child 12-17 years (under expert supervision) (body-weight up to 50 kg): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses
- Child 12-17 years (under expert supervision) (body-weight 50 kg and above): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses; maximum 40 mg per day

Heart failure

► BY MOUTH

- Neonate (under expert supervision): Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.
- Child 1 month-11 years (under expert supervision): Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, then increased if necessary up to 1 mg/kg daily in 1–2 divided doses
- Child 12-17 years (under expert supervision) (body-weight up to 50 kg): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses
- Child 12-17 years (under expert supervision) (body-weight 50 kg and above): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses; maximum 40 mg per day

Proteinuria in nephritis (under expert supervision)

► BY MOUTH

- Neonate: Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.
- Child 1 month-11 years: Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, then increased if necessary up to 1 mg/kg daily in 1–2 divided doses
- Child 12-17 years (body-weight up to 50 kg): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses
- Child 12-17 years (body-weight 50 kg and above): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses; maximum 40 mg per day

Diabetic nephropathy (under expert supervision)

► BY MOUTH

- Child 12-17 years (body-weight up to 50 kg): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours; maintenance 10–20 mg daily in 1–2 divided doses
- Child 12-17 years (body-weight 50 kg and above): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours; maintenance 10–20 mg daily in 1–2 divided doses; maximum 40 mg per day

● **UNLICENSED USE** Not licensed for use in children for congestive heart failure, proteinuria in nephritis or diabetic nephropathy; not licensed for use in children less than 20 kg for hypertension.

● **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

► **Common or very common** Depression · hypersensitivity · vision blurred

► **Uncommon** Anaemia · appetite decreased · asthma · bone marrow disorders · flushing · gastrointestinal disorders · hoarseness · hypoglycaemia · malaise · muscle cramps · nervousness · proteinuria · rhinorrhoea · sleep disorders · throat pain

► **Rare or very rare** Autoimmune disorder · gynaecomastia · hepatic disorders · lymphadenopathy · oral disorders · Raynaud's phenomenon · toxic epidermal necrolysis

► **Frequency not known** Arthritis · leucocytosis · myositis · serositis · SIADH · vasculitis

● **BREAST FEEDING** Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.

● **HEPATIC IMPAIRMENT** Enalapril is a prodrug.

● **RENAL IMPAIRMENT** EvGr Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m^2 (no information available). Ⓜ
Dose adjustments See p. 15.

● **DIRECTIONS FOR ADMINISTRATION** Expert sources advise tablets may be crushed and suspended in water immediately before use.

● **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Enalapril for high blood pressure
www.medicinesforchildren.org.uk/medicines/enalapril-for-high-blood-pressure/

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Enalapril maleate (Non-proprietary)
Enalapril maleate 2.5 mg Enalapril 2.5mg tablets | 28 tablet PoM £9.66 DT = £6.67
Enalapril maleate 5 mg Enalapril 5mg tablets | 28 tablet PoM £7.58 DT = £6.39
Enalapril maleate 10 mg Enalapril 10mg tablets | 28 tablet PoM £5.64 DT = £4.68
Enalapril maleate 20 mg Enalapril 20mg tablets | 28 tablet PoM £6.63 DT = £3.70

► Innovace (Organon Pharma (UK) Ltd)
Enalapril maleate 2.5 mg Innovace 2.5mg tablets | 28 tablet PoM £5.35 DT = £6.67
Enalapril maleate 5 mg Innovace 5mg tablets | 28 tablet PoM £7.51 DT = £6.39
Enalapril maleate 10 mg Innovace 10mg tablets | 28 tablet PoM £10.53 DT = £4.68
Enalapril maleate 20 mg Innovace 20mg tablets | 28 tablet PoM £12.51 DT = £3.70

124

Lisinopril

11-Jun-2021

● **INDICATIONS AND DOSE**

Hypertension

► BY MOUTH

- Child 6–11 years (under expert supervision): Initially 70 micrograms/kg once daily (max. per dose 5 mg), increased to up to 600 micrograms/kg once daily, alternatively increased to up to 40 mg once daily, dose to be increased in intervals of 1–2 weeks
- Child 12–17 years (under expert supervision): Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day

Proteinuria in nephritis (under expert supervision)

► BY MOUTH

- Child 6–11 years: Initially 70 micrograms/kg once daily (max. per dose 5 mg), increased to up to 600 micrograms/kg once daily, alternatively increased to up to 40 mg once daily, dose to be increased in intervals of 1–2 weeks
- Child 12–17 years: Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day

Diabetic nephropathy (under expert supervision)

► BY MOUTH

- Child 12–17 years: Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day

Heart failure (adjunct) (under close medical supervision)

► BY MOUTH

- Child 12–17 years: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day

● **UNLICENSED USE** Not licensed for use in children.

● **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

► **Common or very common** Postural disorders

► **Uncommon** Hallucination · mood altered · Raynaud's phenomenon

► **Rare or very rare** Anaemia · autoimmune disorder · azotaemia · bone marrow depression · gynaecomastia · hepatic disorders · hypersensitivity · hypoglycaemia · lymphadenopathy · olfactory nerve disorder · SIADH · sinusitis · toxic epidermal necrolysis

► **Frequency not known** Depressive symptom · leucocytosis · vasculitis

● **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

● **RENAL IMPAIRMENT** EvGr Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m^2. M **Dose adjustments** See p. 15.

● **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of lisinopril is required, the following strength is used: 20 mg/5 mL.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Lisinopril for high blood pressure www.medicinesforchildren.org.uk/medicines/lisinopril-for-high-blood-pressure/

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

► Lisinopril (Non-proprietary)

Lisinopril 1 mg per 1 ml Lisinopril 5mg/5ml oral solution sugar free sugar-free | 150 ml PoM £154.11 DT = £154.11

Tablet

► Lisinopril (Non-proprietary)

Lisinopril 2.5 mg Lisinopril 2.5mg tablets | 28 tablet PoM £3.77 DT = £0.73 | 500 tablet PoM £11.84–£13.04

Lisinopril 5 mg Lisinopril 5mg tablets | 28 tablet PoM £7.54 DT = £0.82 | 500 tablet PoM £10.93–£13.75

Lisinopril 10 mg Lisinopril 10mg tablets | 28 tablet PoM £11.81 DT = £0.80 | 500 tablet PoM £10.78–£19.29

Lisinopril 20 mg Lisinopril 20mg tablets | 28 tablet PoM £10.42 DT = £0.92 | 500 tablet PoM £12.75–£16.25

► Zestril (Atnahs Pharma UK Ltd)

Lisinopril 5 mg Zestril 5mg tablets | 28 tablet PoM £9.42 DT = £0.82

Lisinopril 10 mg Zestril 10mg tablets | 28 tablet PoM £14.76 DT = £0.80

Lisinopril 20 mg Zestril 20mg tablets | 28 tablet PoM £13.02 DT = £0.92

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM › ANGIOTENSIN II RECEPTOR ANTAGONISTS

Angiotensin II receptor antagonists

● **CAUTIONS** Aortic or mitral valve stenosis · hypertrophic cardiomyopathy · patients of black African or African-Caribbean origin · patients with a history of angioedema · patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) · renal artery stenosis

● **SIDE-EFFECTS**

► **Common or very common** Abdominal pain · asthenia · back pain · cough · diarrhoea · dizziness · headache · hyperkalaemia · hypotension · nausea · postural hypotension (more common in patients with intravascular volume depletion, e.g. those taking high-dose diuretics) · renal impairment · skin reactions · vertigo · vomiting

► **Uncommon** Angioedema · hepatic function abnormal · myalgia · thrombocytopenia

► **Rare or very rare** Arthralgia

● **PREGNANCY** Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

● **BREAST FEEDING** Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

● **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).

● **RENAL IMPAIRMENT**

Dose adjustments In general, manufacturers advise start with low dose and adjust according to response.

● **MONITORING REQUIREMENTS** Monitor plasma-potassium concentration, particularly in children with renal impairment.

above

Candesartan cilexetil

16-May-2022

● **INDICATIONS AND DOSE**

Hypertension

► BY MOUTH

- Child 6–17 years (under expert supervision) (body-weight up to 50 kg): Initially 4 mg once daily, lower continued →

dose may be used in intravascular volume depletion; increased if necessary up to 8 mg once daily
- Child 6–17 years (under expert supervision) (body-weight 50 kg and above): Initially 4 mg once daily, lower dose may be used in intravascular volume depletion; increased if necessary up to 16 mg once daily

- **CONTRA-INDICATIONS** Cholestasis
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
- **Common or very common** Fever · increased risk of infection · oropharyngeal pain · sinus arrhythmia
- **Uncommon** Hyponatraemia
- **Rare or very rare** Agranulocytosis · hepatitis · leucopenia · neutropenia
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment or cholestasis.
Dose adjustments In adults, manufacturer advises dose reduction—consult product literature.
- **RENAL IMPAIRMENT** See p. 15. EvGr Caution if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m^2 (no information available). M

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Candesartan cilexetil (Non-proprietary)**
Candesartan cilexetil 2 mg Candesartan 2mg tablets | 7 tablet PoM £3.11 DT = £0.94 | 28 tablet PoM £1.88–£9.28
Candesartan cilexetil 4 mg Candesartan 4mg tablets | 7 tablet PoM £3.88 DT = £0.68 | 28 tablet PoM £0.49–£9.78 | 500 tablet PoM £25.94–£61.43
Candesartan cilexetil 8 mg Candesartan 8mg tablets | 28 tablet PoM £9.89 DT = £1.12
Candesartan cilexetil 16 mg Candesartan 16mg tablets | 28 tablet PoM £12.72 DT = £1.21
Candesartan cilexetil 32 mg Candesartan 32mg tablets | 28 tablet PoM £16.13 DT = £1.41
- **Amias** (Neon Healthcare Ltd)
Candesartan cilexetil 2 mg Amias 2mg tablets | 7 tablet PoM £3.58 DT = £0.94

Candesartan cilexetil 8 mg Amias 8mg tablets | 28 tablet PoM £9.89 DT = £1.12
Candesartan cilexetil 16 mg Amias 16mg tablets | 28 tablet PoM £12.72 DT = £1.21
Candesartan cilexetil 32 mg Amias 32mg tablets | 28 tablet PoM £16.13 DT = £1.41

F 127

Losartan potassium

10-Jun-2021

- **INDICATIONS AND DOSE**

Hypertension

- BY MOUTH
- Child 6–17 years (under expert supervision) (body-weight 20–49 kg): Initially 700 micrograms/kg once daily (max. per dose 25 mg), adjusted according to response to 50 mg daily, lower initial dose may be used in intravascular volume depletion; maximum 50 mg per day
- Child 6–17 years (under expert supervision) (body-weight 50 kg and above): Initially 50 mg once daily, adjusted according to response to 1.4 mg/kg once daily; maximum 100 mg per day

Hypertension with intravascular volume depletion

- BY MOUTH
- Child 6–17 years (under expert supervision) (body-weight 50 kg and above): Initially 25 mg once daily; adjusted according to response to 1.4 mg/kg once daily; maximum 100 mg per day

- **CAUTIONS** Severe heart failure
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
- **Common or very common** Anaemia · hypoglycaemia · postural disorders
- **Uncommon** Angina pectoris · constipation · drowsiness · dyspnoea · oedema · palpitations · sleep disorder
- **Rare or very rare** Atrial fibrillation · hepatitis · hypersensitivity · paraesthesia · stroke · syncope · vasculitis
- **Frequency not known** Depression · erectile dysfunction · hyponatraemia · influenza like illness · malaise · migraine · pancreatitis · photosensitivity reaction · rhabdomyolysis · taste altered · tinnitus · urinary tract infection
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in all degrees of impairment (no information available).
- **RENAL IMPAIRMENT** EvGr Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m^2 (no information available). M See p. 15.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include berry-citrus.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Losartan potassium (Non-proprietary)**
Losartan potassium 12.5 mg Losartan 12.5mg tablets | 28 tablet PoM £30.00 DT = £2.22
Losartan potassium 25 mg Losartan 25mg tablets | 28 tablet PoM £16.18 DT = £1.10
Losartan potassium 50 mg Losartan 50mg tablets | 28 tablet PoM £16.15 DT = £1.23 | 500 tablet PoM £21.96–£68.88
Losartan potassium 100 mg Losartan 100mg tablets | 28 tablet PoM £16.18 DT = £1.50
- **Cozaar** (Organon Pharma (UK) Ltd)
Losartan potassium 12.5 mg Cozaar 12.5mg tablets | 28 tablet PoM £9.70 DT = £2.22
Losartan potassium 25 mg Cozaar 25mg tablets | 28 tablet PoM £16.18 DT = £1.10
Losartan potassium 50 mg Cozaar 50mg tablets | 28 tablet PoM £12.80 DT = £1.23
Losartan potassium 100 mg Cozaar 100mg tablets | 28 tablet PoM £16.18 DT = £1.50

F 127

Valsartan

10-Jun-2021

- **INDICATIONS AND DOSE**

Hypertension

- BY MOUTH
- Child 6–17 years (under expert supervision) (body-weight 18–34 kg): Initially 40 mg once daily, adjusted according to response; maximum 80 mg per day
- Child 6–17 years (under expert supervision) (body-weight 35–79 kg): Initially 80 mg once daily, adjusted according to response; maximum 160 mg per day
- Child 6–17 years (under expert supervision) (body-weight 80 kg and above): Initially 80 mg once daily, adjusted according to response; maximum 320 mg per day

- **UNLICENSED USE** Capsules not licensed for use in children.
- **CONTRA-INDICATIONS** Biliary cirrhosis · cholestasis
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
- **Uncommon** Heart failure · syncope
- **Frequency not known** Neutropenia · serum sickness · vasculitis

- **HEPATIC IMPAIRMENT**
  Dose adjustments Manufacturer advises maximum 80 mg daily in mild to moderate impairment.
- **RENAL IMPAIRMENT** See p. 15. EvGr Avoid if creatinine clearance is less than 30 mL/minute (no information available). M

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

- **Diovan** (Novartis Pharmaceuticals UK Ltd)
  Valsartan 3 mg per 1 ml Diovan 3mg/1ml oral solution | 160 ml PoM £7.20 DT = £7.20

Tablet

- **Valsartan (Non-proprietary)**
  Valsartan 40 mg Valsartan 40mg tablets | 7 tablet PoM £9.54 DT = £9.54 | 28 tablet PoM £5.00–£9.54
  Valsartan 80 mg Valsartan 80mg tablets | 28 tablet PoM £13.69 DT = £11.23
  Valsartan 160 mg Valsartan 160mg tablets | 28 tablet PoM £14.69 DT = £14.69
  Valsartan 320 mg Valsartan 320mg tablets | 28 tablet PoM £20.23 DT = £18.17

Capsule

- **Valsartan (Non-proprietary)**
  Valsartan 40 mg Valsartan 40mg capsules | 28 capsule PoM £13.97 DT = £2.66
  Valsartan 80 mg Valsartan 80mg capsules | 28 capsule PoM £13.97 DT = £3.05
  Valsartan 160 mg Valsartan 160mg capsules | 28 capsule PoM £18.41 DT = £5.14

VASODILATORS › POTASSIUM-CHANNEL OPENERS

Minoxidil

08-Nov-2021

- **INDICATIONS AND DOSE**

Severe hypertension

- BY MOUTH
- Child 1 month-11 years: Initially 200 micrograms/kg daily in 1–2 divided doses, then increased in steps of 100–200 micrograms/kg, increased at intervals of at least 3 days; maximum 1 mg/kg per day
- Child 12-17 years: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg daily, increased at intervals of at least 3 days; maximum 100 mg per day

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Acute porphyrias p. 688 · after myocardial infarction (until stabilised) · angina
- **INTERACTIONS** → Appendix 1: minoxidil
- **SIDE-EFFECTS**
- **Common or very common** Fluid retention · hair changes · oedema · pericardial disorders · pericarditis · tachycardia
- **Rare or very rare** Leucopenia · skin reactions · Stevens-Johnson syndrome · thrombocytopenia
- **Frequency not known** Angina pectoris · breast tenderness · gastrointestinal disorder · pleural effusion · sodium retention · weight increased
- **PREGNANCY** Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **RENAL IMPAIRMENT** EvGr Caution in significant impairment. M
  Dose adjustments EvGr Smaller doses may be required in renal failure. M

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Loniten** (Pfizer Ltd)
  Minoxidil 2.5 mg Loniten 2.5mg tablets | 60 tablet PoM £8.88 DT = £8.88
  Minoxidil 5 mg Loniten 5mg tablets | 60 tablet PoM £15.83 DT = £15.83
  Minoxidil 10 mg Loniten 10mg tablets | 60 tablet PoM £30.68 DT = £30.68

VASODILATORS › VASODILATOR ANTIHYPERTENSIVES

Hydralazine hydrochloride

08-Dec-2021

- **INDICATIONS AND DOSE**

Resistant hypertension (adjunct)

- BY MOUTH
- Neonate: 250–500 micrograms/kg every 8–12 hours, increased if necessary to 2–3 mg/kg every 8 hours.
- Child 1 month-11 years: 250–500 micrograms/kg every 8–12 hours, increased if necessary to 7.5 mg/kg daily; maximum 200 mg per day
- Child 12-17 years: 25 mg twice daily, increased to 50–100 mg twice daily
- BY SLOW INTRAVENOUS INJECTION
- Neonate: 100–500 micrograms/kg, dose may be repeated if necessary every 4–6 hours; maximum 3 mg/kg per day.
- Child 1 month-11 years: 100–500 micrograms/kg, dose may be repeated if necessary every 4–6 hours; maximum 3 mg/kg per day; maximum 60 mg per day
- Child 12-17 years: 5–10 mg, dose may be repeated if necessary every 4–6 hours
- BY CONTINUOUS INTRAVENOUS INFUSION
- Neonate: 12.5–50 micrograms/kg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 2 mg/kg per day.
- Child 1 month-11 years: 12.5–50 micrograms/kg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 3 mg/kg per day
- Child 12-17 years: 3–9 mg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 3 mg/kg per day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · cor pulmonale · dissecting aortic aneurysm · high output heart failure · idiopathic systemic lupus erythematosus · myocardial insufficiency due to mechanical obstruction · severe tachycardia
- **CAUTIONS** Cerebrovascular disease · coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised) · occasionally blood pressure reduction too rapid even with low parenteral doses
- **INTERACTIONS** → Appendix 1: hydralazine
- **SIDE-EFFECTS**
- **Common or very common** Angina pectoris · diarrhoea · dizziness · flushing · gastrointestinal disorders · headache · hypotension · joint disorders · lupus-like syndrome (after long-term therapy (more common in slow acetylator individuals)) · myalgia · nasal congestion · nausea · palpitations · tachycardia · vomiting
- **Rare or very rare** Acute kidney injury · agranulocytosis · anaemia · anxiety · appetite decreased · conjunctivitis · depression · dyspnoea · eosinophilia · eye disorders · fever · glomerulonephritis · haematuria · haemolytic anaemia · hallucination · heart failure · hepatic disorders ·

leucocytosis · leucopenia · lymphadenopathy · malaise · nerve disorders · neutropenia · oedema · pancytopenia · paradoxical pressor response · paraesthesia · pleuritic pain · proteinuria · skin reactions · splenomegaly · thrombocytopenia · urinary retention · vasculitis · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION The incidence of side-effects is lower if the dose is kept low, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

- **PREGNANCY** Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.
- **BREAST FEEDING** Present in milk but not known to be harmful.
  Monitoring Monitor infant in breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of accumulation).
  Dose adjustments Manufacturer advises adjust dose or dosing interval according to clinical response.
- **RENAL IMPAIRMENT**
  Dose adjustments See p. 15.
  In adults, manufacturer advises adjust dose or dosing interval according to clinical response if creatinine clearance less than 30 mL/minute (consult product literature).
- **MONITORING REQUIREMENTS** Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose, but evidence of clinical value unsatisfactory.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use For administration *by mouth*, diluted injection may be given orally.
  - With intravenous use For *continuous intravenous infusion*, initially reconstitute 20 mg with 1 mL Water for Injections, then dilute with Sodium Chloride 0.9%. Incompatible with Glucose intravenous infusion. For *intravenous injection*, initially reconstitute 20 mg with 1 mL Water for Injections, then dilute to a concentration of 0.5–1 mg/mL with Sodium Chloride 0.9% and administer over 5–20 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Tablet

EXCIPIENTS: May contain Gluten, propylene glycol

- **Hydralazine hydrochloride (Non-proprietary)**
  Hydralazine hydrochloride 10 mg Apo-Hydralazine 10mg tablets | 100 tablet PoM ⊠
  Hydralazine hydrochloride 25 mg Hydralazine 25mg tablets | 56 tablet PoM £7.37 DT = £3.51 | 84 tablet PoM £14.00
  Hydralazine hydrochloride 50 mg Hydralazine 50mg tablets | 56 tablet PoM £15.46 DT = £4.94
- **Apresoline** (Advanz Pharma)
  Hydralazine hydrochloride 25 mg Apresoline 25mg tablets | 84 tablet PoM £3.38

Powder for solution for injection

- **Hydralazine hydrochloride (Non-proprietary)**
  Hydralazine hydrochloride 20 mg Hydralazine 20mg powder for concentrate for solution for injection ampoules | 5 ampoule PoM £74.17

4.1a Hypertension associated with phaeochromocytoma

Other drugs used for Hypertension associated with phaeochromocytoma Propranolol hydrochloride, p. 116

VASODILATORS › PERIPHERAL VASODILATORS

Phenoxybenzamine hydrochloride

20-Sep-2021

- **INDICATIONS AND DOSE**

Hypertension in phaeochromocytoma

- BY MOUTH
- Child: 0.5–1 mg/kg twice daily, adjusted according to response

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** During recovery period after myocardial infarction (usually 3–4 weeks) · history of cerebrovascular accident
- **CAUTIONS** Avoid in Acute porphyrias p. 688 · carcinogenic in *animals* · cerebrovascular disease · congestive heart failure · severe ischaemic heart disease
- **SIDE-EFFECTS** Abdominal distress · dizziness · ejaculation failure · fatigue · miosis · nasal congestion · postural hypotension · reflex tachycardia
- **PREGNANCY** Hypotension may occur in newborn.
- **BREAST FEEDING** May be present in milk.
- **RENAL IMPAIRMENT** EvGr Use with caution. Ⓜ
- **DIRECTIONS FOR ADMINISTRATION** For administration *by mouth*, expert sources advise capsules may be opened.
- **HANDLING AND STORAGE** Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

- **Phenoxybenzamine hydrochloride (Non-proprietary)**
  Phenoxybenzamine hydrochloride 10 mg Phenoxybenzamine 10mg capsules | 30 capsule PoM £129.21 DT = £129.21

4.1b Hypertensive crises

Other drugs used for Hypertensive crises Hydralazine hydrochloride, p. 129 · Labetalol hydrochloride, p. 115

VASODILATORS › VASODILATOR ANTIHYPERTENSIVES

Sodium nitroprusside

05-Oct-2021

- **INDICATIONS AND DOSE**

Hypertensive emergencies

- BY CONTINUOUS INTRAVENOUS INFUSION
- Neonate: Initially 500 nanograms/kg/minute, then increased in steps of 200 nanograms/kg/minute (max. per dose 8 micrograms/kg/minute) as required, max. 4 micrograms/kg/minute if used for longer than 24 hours.
- Child: Initially 500 nanograms/kg/minute, then increased in steps of 200 nanograms/kg/minute (max. per dose 8 micrograms/kg/minute) as required, max. 4 micrograms/kg/minute if used for longer than 24 hours

- **UNLICENSED USE** Not licensed for use in the UK.
- **CONTRA-INDICATIONS** Compensatory hypertension · impaired cerebral circulation · Leber's optic atrophy · severe vitamin B_{12} deficiency

- **CAUTIONS** Hyponatraemia · hypothermia · hypothyroidism · ischaemic heart disease
- **INTERACTIONS** → Appendix 1: nitroprusside
- **SIDE-EFFECTS** Abdominal pain · anaemia · arrhythmias · chest discomfort · cyanide toxicity · dizziness · flushing · headache · hyperhidrosis · hypothyroidism · hypovolaemia · ileus · intracranial pressure increased · methaemoglobinaemia · muscle twitching · nausea · palpitations · rash · thiocyanate toxicity

  SIDE-EFFECTS, FURTHER INFORMATION Side-effects associated with over rapid reduction in blood pressure: Headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort—reduce infusion rate if any of these side-effects occur.

  Overdose Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see cyanide in Emergency treatment of poisoning p. 944).
- **PREGNANCY** Avoid prolonged use—potential for accumulation of cyanide in fetus.
- **BREAST FEEDING** No information available. Caution advised due to thiocyanate metabolite.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate.
- **RENAL IMPAIRMENT** Avoid prolonged use—cyanide or thiocyanate metabolites may accumulate.
- **MONITORING REQUIREMENTS** Monitor blood pressure (including intra-arterial blood pressure) and blood-cyanide concentration, and if treatment exceeds 3 days, also blood thiocyanate concentration.
- **TREATMENT CESSATION** Avoid sudden withdrawal—terminate infusion over 15–30 minutes.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* in Glucose 5%, manufacturer advises infuse *via* infusion device to allow precise control. For further details, consult product literature. Protect infusion from light.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

- **Sodium nitroprusside (Non-proprietary)**

  Sodium nitroprusside dihydrate 50 mg Nitroprussiat Fides 50mg powder and solvent for solution for infusion vials | 1 vial PoM (Hospital only)

  Sodium nitroprusside 50mg powder and solvent for solution for infusion vials | 1 vial PoM (Hospital only)

4.1c Pulmonary hypertension

ENDOTHELIN RECEPTOR ANTAGONISTS

Bosentan

05-Feb-2020

- **INDICATIONS AND DOSE**

Pulmonary arterial hypertension (initiated under specialist supervision)

- BY MOUTH
- Child 2-17 years (body-weight 10-20 kg): Initially 31.25 mg once daily for 4 weeks, then increased to 31.25 mg twice daily
- Child 2-17 years (body-weight 20-40 kg): Initially 31.25 mg twice daily for 4 weeks, then increased to 62.5 mg twice daily
- Child 12-17 years (body-weight 40 kg and above): Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg)

- **CONTRA-INDICATIONS** Acute porphyrias p. 688
- **CAUTIONS** Not to be initiated if systemic systolic blood pressure is below 85 mmHg · pulmonary veno-occlusive disease
- **INTERACTIONS** → Appendix 1: endothelin receptor antagonists
- **SIDE-EFFECTS**
- **Common or very common** Anaemia · diarrhoea · flushing · gastrooesophageal reflux disease · headache · nasal congestion · palpitations · skin reactions · syncope
- **Uncommon** Hepatic disorders · leucopenia · neutropenia · thrombocytopenia
- **Rare or very rare** Angioedema
- **Frequency not known** Vision blurred
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.
- **PREGNANCY** Avoid (teratogenic in *animal* studies).
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment or if baseline serum transaminases exceed 3 times the upper limit of normal.
- **MONITORING REQUIREMENTS**
- Monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly).
- Monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal—withdraw treatment gradually.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Bosentan (Non-proprietary)**

  Bosentan (as Bosentan monohydrate) 62.5 mg Bosentan 62.5mg tablets | 56 tablet PoM £112.50 (Hospital only) | 56 tablet PoM £1,359.19–£1,510.21

  Bosentan (as Bosentan monohydrate) 125 mg Bosentan 125mg tablets | 56 tablet PoM £112.50 (Hospital only) | 56 tablet PoM £101.25–£1,510.21
- **Stayveer** (Advanz Pharma)

  Bosentan (as Bosentan monohydrate) 125 mg Stayveer 125mg tablets | 56 tablet PoM £208.34

PHOSPHODIESTERASE TYPE-5 INHIBITORS

Sildenafil

12-Aug-2021

- **INDICATIONS AND DOSE**

Pulmonary arterial hypertension (initiated under specialist supervision)

- BY MOUTH
- Neonate: Initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response, start with the lower dose and frequency, especially if used with other vasodilators; maximum 30 mg per day.
- Child 1-11 months: Initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response, start with the lower dose and frequency, especially if used with other vasodilators; maximum 30 mg per day

continued →

- Child 1–17 years (body-weight up to 20 kg): 10 mg 3 times a day
- Child 1–17 years (body-weight 20 kg and above): 20 mg 3 times a day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose with concurrent use of moderate and potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir)—no specific recommendation made for children.

- **UNLICENSED USE** Not licensed for use in children under 1 year.
- **CONTRA-INDICATIONS** Hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · recent history of myocardial infarction · recent history of stroke · sickle-cell anaemia
- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · autonomic dysfunction · bleeding disorders · cardiovascular disease · hypotension (avoid if severe) · intravascular volume depletion · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) · pulmonary veno-occlusive disease
- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors
- **SIDE-EFFECTS**
- **Common or very common** Alopecia · anaemia · anxiety · cough · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headaches · increased risk of infection · insomnia · nasal complaints · nausea · night sweats · pain · skin reactions · tremor · vasodilation · vision disorders
- **Uncommon** Arrhythmias · chest pain · drowsiness · dry eye · dry mouth · eye discomfort · eye disorders · eye inflammation · fatigue · feeling hot · gynaecomastia · haemorrhage · hypertension · hypotension · myalgia · numbness · palpitations · sinus congestion · tinnitus · vertigo · vomiting
- **Rare or very rare** Acute coronary syndrome · arteriosclerotic retinopathy · cerebrovascular insufficiency · glaucoma · haematospermia · hearing impairment · irritability · optic neuropathy (discontinue if sudden visual impairment occurs) · oral hypoaesthesia · priapism · retinal occlusion · scleral discolouration · seizure · severe cutaneous adverse reactions (SCARs) · sudden cardiac death · syncope · throat tightness
- **PREGNANCY** Use only if potential benefit outweighs risk—no evidence of harm in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
  Dose adjustments Manufacturer advises if not tolerated, consider dose reduction in mild to moderate impairment—consult product literature.
- **RENAL IMPAIRMENT**
  Dose adjustments EvGr If usual dose not tolerated, consider dose reduction (consult product literature). M
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Sildenafil for pulmonary hypertension www.medicinesforchildren.org.uk/medicines/sildenafil-for-pulmonary-hypertension/
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

- **Sildenafil (*Revatio*®) for the treatment of paediatric patients aged 1 year to 17 years old with pulmonary arterial hypertension (December 2012)** SMC No. 809/12 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, pessary

Tablet

- **Granpidam** (Accord Healthcare Ltd)
  Sildenafil (as Sildenafil citrate) 20 mg Granpidam 20mg tablets | 90 tablet PoM £424.01 DT = £446.33
- **Revatio** (Viatris UK Healthcare Ltd)
  Sildenafil (as Sildenafil citrate) 20 mg Revatio 20mg tablets | 90 tablet PoM £446.33 DT = £446.33

Oral suspension

- **Revatio** (Viatris UK Healthcare Ltd)
  Sildenafil (as Sildenafil citrate) 10 mg per 1 ml Revatio 10mg/ml oral suspension sugar-free | 112 ml PoM £186.75 DT = £186.75

PROSTAGLANDINS AND ANALOGUES

Epoprostenol

25-Jan-2021

(Prostacyclin)

- **DRUG ACTION** Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

- **INDICATIONS AND DOSE**

Persistent pulmonary hypertension of the newborn

- BY CONTINUOUS INTRAVENOUS INFUSION
- Neonate: Initially 2 nanograms/kg/minute (max. per dose 20 nanograms/kg/minute), adjusted according to response, rarely doses up to 40 nanograms/kg/minute are used.

Idiopathic pulmonary arterial hypertension

- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: Initially 2 nanograms/kg/minute, increased if necessary up to 40 nanograms/kg/minute

PHARMACOKINETICS

- Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Severe left ventricular dysfunction
- **CAUTIONS** Avoid abrupt withdrawal (risk of rebound pulmonary hypertension/pulmonary hypertensive crisis) · extreme caution in coronary artery disease · haemorrhagic diathesis · pulmonary veno-occlusive disease · reconstituted solution highly alkaline—avoid extravasation (irritant to tissues) · risk of pulmonary oedema (dose titration for pulmonary hypertension should be in hospital)
- **INTERACTIONS** → Appendix 1: epoprostenol
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain · anxiety · arrhythmias · arthralgia · chest discomfort · diarrhoea · flushing · haemorrhage · headache · intracranial haemorrhage · nausea · pain · rash · sepsis · vomiting
- **Uncommon** Dry mouth · hyperhidrosis
- **Rare or very rare** Fatigue · hyperthyroidism · intravenous catheter occlusion · local infection · pallor
- **Frequency not known** Ascites · pulmonary oedema (avoid chronic use if occurs during dose titration) · spleen abnormalities
- **PREGNANCY** Manufacturer advises caution—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Anticoagulant monitoring required when given with anticoagulants.
  - Monitor blood pressure.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of rebound pulmonary hypertension and pulmonary hypertensive crisis).
- **DIRECTIONS FOR ADMINISTRATION** Directions for administration vary depending on the preparation used—for instructions *in adults*, consult product literature. For *neonatal intensive care*—consult local protocols.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Epoprostenol (Non-proprietary)**
  Epoprostenol (as Epoprostenol sodium)
  500 microgram Epoprostenol 500microgram powder (pH12) for solution for infusion vials | 1 vial PoM ¥ (Hospital only)
  Epoprostenol (as Epoprostenol sodium) 1.5 mg Epoprostenol 1.5mg powder (pH12) for solution for infusion vials | 1 vial PoM ¥ (Hospital only)
- **Veletri** (Janssen-Cilag Ltd)
  Epoprostenol (as Epoprostenol sodium) 500 microgram Veletri 500microgram powder for solution for infusion vials | 1 vial PoM £24.44
  Epoprostenol (as Epoprostenol sodium) 1.5 mg Veletri 1.5mg powder for solution for infusion vials | 1 vial PoM £49.24

Powder and solvent for solution for infusion

ELECTROLYTES: May contain Sodium

- **Epoprostenol (Non-proprietary)**
  Epoprostenol (as Epoprostenol sodium)
  500 microgram Epoprostenol 500microgram powder and solvent (pH10.5) for solution for infusion vials | 1 vial PoM £58.95
  Epoprostenol (as Epoprostenol sodium) 1.5 mg Epoprostenol 1.5mg powder and solvent (pH10.5) for solution for infusion vials | 1 vial PoM £118.75
- **Flolan** (GlaxoSmithKline UK Ltd)
  Epoprostenol (as Epoprostenol sodium) 500 microgram Flolan 500microgram powder and solvent (pH12) for solution for infusion vials | 1 vial PoM £22.22
  Epoprostenol (as Epoprostenol sodium) 1.5 mg Flolan 1.5mg powder and solvent (pH12) for solution for infusion vials | 1 vial PoM £44.76

Iloprost

13-Jan-2021

- **INDICATIONS AND DOSE**

Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)

- BY INHALATION OF NEBULISED SOLUTION
- Child 8-17 years: Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduce to lower maintenance dose if high dose not tolerated

Raynaud's syndrome

- BY INTRAVENOUS INFUSION
- Child 12-17 years: Initially 0.5 nanogram/kg/minute, increased to 1–2 nanograms/kg/minute given over 6 hours daily for 3–5 days, dose increase should be performed gradually

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS**

GENERAL CONTRA-INDICATIONS Conditions which increase risk of haemorrhage · congenital or acquired valvular defects with myocardial function disorders (not related to pulmonary hypertension) · decompensated heart failure (unless under close medical supervision) · severe arrhythmias · severe coronary heart disease · unstable angina · within 3 months of cerebrovascular events · within 6 months of myocardial infarction

SPECIFIC CONTRA-INDICATIONS

- When used by inhalation Pulmonary veno-occlusive disease · systolic blood pressure below 85 mmHg · unstable pulmonary hypertension with advanced right heart failure
- With intravenous use Acute or chronic congestive heart failure (NYHA II-IV) · pulmonary oedema

- **CAUTIONS**

GENERAL CAUTIONS Hypotension

SPECIFIC CAUTIONS

- When used by inhalation Acute pulmonary infection · severe asthma
- With intravenous use Significant heart disease

- **INTERACTIONS** → Appendix 1: iloprost
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Cough · diarrhoea · dizziness · dyspnoea · haemorrhage · hypotension · nausea · pain · palpitations · syncope · vomiting
- **Uncommon** Taste altered · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- **Common or very common**
  - When used by inhalation Chest discomfort · headache · oral disorders · rash · tachycardia · throat complaints · vasodilation
  - With intravenous use Angina pectoris · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bradyphrenia · chills · confusion · drowsiness · feeling hot · fever · flushing · gastrointestinal discomfort · headaches · hyperhidrosis · muscle complaints · sensation abnormal · thirst · vertigo
- **Uncommon**
  - With intravenous use Asthma · cerebrovascular insufficiency · constipation · depression · dry mouth · dysphagia · dysuria · embolism and thrombosis · eye discomfort · hallucination · heart failure · hepatic impairment · myocardial infarction · pruritus · pulmonary oedema · renal pain · seizure · tetany · tremor · vision blurred
- **Frequency not known**
  - When used by inhalation Respiratory disorders

- **PREGNANCY**
  - When used by inhalation Use if potential benefit outweighs risk.
  - With intravenous use Manufacturer advises avoid––toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
  Dose adjustments In adults, manufacturer advises initial dose reduction—consult product literature.
- **MONITORING REQUIREMENTS**
  - With intravenous use Manufacturer advises monitor blood pressure and heart rate at the start of the infusion and at every dose increase.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *intravenous infusion* dilute to a concentration of 200 nanograms/mL with Glucose 5% or Sodium Chloride 0.9%; alternatively, may be diluted to a concentration of 2 micrograms/mL and given via syringe driver.
  - When used by inhalation For *inhaled treatment*, to minimise accidental exposure use only with nebulisers listed in product literature in a well ventilated room.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - When used by inhalation Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.

- With intravenous use Concentrate for infusion available on a named patient basis from Bayer Schering in 0.5 mL and 1 mL ampoules.

- **HANDLING AND STORAGE** Manufacturer advises avoid contact with skin and eyes.

- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  Solution for infusion
  EXCIPIENTS: May contain Ethanol
  - **Iloprost (Non-proprietary)**
    Iloprost (as Iloprost trometamol) 100 microgram per 1 ml Ilomedin 100micrograms/1ml solution for infusion ampoules | 1 ampoule PoM
    Iloprost 50micrograms/0.5ml concentrate for solution for infusion ampoules | 1 ampoule PoM £75.00 (Hospital only) | 5 ampoule PoM £300.00 (Hospital only)
  Nebuliser liquid
  EXCIPIENTS: May contain Ethanol
  - **Iloprost (Non-proprietary)**
    Iloprost (as Iloprost trometamol) 10 microgram per 1 ml Iloprost 10micrograms/1ml nebuliser liquid ampoules | 30 ampoule PoM £300.00 | 160 ampoule PoM £1,700.00
    Iloprost (as Iloprost trometamol) 20 microgram per 1 ml Iloprost 20micrograms/1ml nebuliser liquid ampoules | 30 ampoule PoM £375.00 (Hospital only) | 168 ampoule PoM £2,000.00 (Hospital only)
  - **Ventavis** (Bayer Plc)
    Iloprost (as Iloprost trometamol) 10 microgram per 1 ml Ventavis 10micrograms/ml nebuliser solution 1ml ampoules | 42 ampoule PoM £560.27 | 168 ampoule PoM £2,241.08
    Ventavis 10micrograms/ml nebuliser solution 1ml ampoules with Breelib | 168 ampoule PoM £2,241.08
    Iloprost (as Iloprost trometamol) 20 microgram per 1 ml Ventavis 20micrograms/ml nebuliser solution 1ml ampoules with Breelib | 168 ampoule PoM £2,241.08
    Ventavis 20micrograms/ml nebuliser solution 1ml ampoules | 42 ampoule PoM £560.27

VASODILATORS › PERIPHERAL VASODILATORS

Tolazoline

- **DRUG ACTION** Tolazoline is an alpha-blocker and produces both pulmonary and systemic vasodilation.

- **INDICATIONS AND DOSE**
  Correction of pulmonary vasospasm in neonates
  - INITIALLY BY INTRAVENOUS INJECTION
  - Neonate: Initially 1 mg/kg, to be given over 2–5 minutes, followed by (by continuous intravenous infusion) maintenance 200 micrograms/kg/hour if required, careful blood pressure monitoring should be carried out, doses above 300 micrograms/kg/hour associated with cardiotoxicity and renal failure.
  - BY ENDOTRACHEAL TUBE
  - Neonate: 200 micrograms/kg.

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Peptic ulcer disease

- **CAUTIONS** Cardiotoxic accumulation may occur with continuous infusion (particularly in renal impairment) · mitral stenosis

- **SIDE-EFFECTS** Arrhythmias · blood disorder · chills · diarrhoea · epigastric pain · flushing · haematuria · haemorrhage (with high doses) · headache · hyperhidrosis · hypertension (with high doses) · hypotension (severe; with high doses) · metabolic alkalosis · nausea · oliguria · rash macular · renal failure (with high doses) · thrombocytopenia · vomiting

- **RENAL IMPAIRMENT** Accumulates in renal impairment. Risk of cardiotoxicity.
  Dose adjustments Lower doses may be necessary.

- **MONITORING REQUIREMENTS** Monitor blood pressure regularly for sustained systemic hypotension.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%. Prepare a fresh solution every 24 hours. For *endotracheal administration*, dilute with 0.5–1 mL of Sodium Chloride 0.9%.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: solution for injection

4.2 Hypotension and shock

Sympathomimetics

Overview

The properties of sympathomimetics vary according to whether they act on alpha or on beta adrenergic receptors. Response to sympathomimetics can also vary considerably in children, particularly neonates. It is important to titrate the dose to the desired effect and to monitor the child closely.

Inotropic sympathomimetics

Dopamine hydrochloride p. 136 has a variable, unpredictable, and dose dependent impact on vascular tone. Low dose infusion normally causes vasodilatation, but there is little evidence that this is clinically beneficial; moderate doses increase myocardial contractility and cardiac output in older children, but in neonates moderate doses may cause a reduction in cardiac output. High doses cause vasoconstriction and increase vascular resistance, and should therefore be used with caution following cardiac surgery, or where there is co-existing neonatal pulmonary hypertension.

In neonates the response to inotropic sympathomimetics varies considerably, particularly in those born prematurely; careful dose titration and monitoring are necessary.

Isoprenaline injection is available from 'special-order' manufacturers or specialist importing companies.

Shock

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis or myocardial insufficiency should be corrected. Additional treatment is dependent on the type of shock.

Septic shock is associated with severe hypovolaemia (due to vasodilation and capillary leak) which should be corrected with crystalloids or colloids. If hypotension persists despite volume replacement, dopamine hydrochloride should be started. For shock refractory to treatment with dopamine hydrochloride, if cardiac output is high and peripheral vascular resistance is low (warm shock), noradrenaline/norepinephrine p. 137 should be added *or* if cardiac output is low and peripheral vascular resistance is high (cold shock), adrenaline/epinephrine p. 149 should be added. Additionally, in cold shock, a vasodilator such as milrinone p. 141, glyceryl trinitrate p. 149, or sodium nitroprusside p. 130 (on specialist advice only) can be used to reduce vascular resistance.

If the shock is resistant to volume expansion and catecholamines, and there is suspected or proven adrenal insufficiency, low dose hydrocortisone p. 506 can be used. ACTH-stimulated plasma-cortisol concentration should be measured; however, hydrocortisone can be started without such information. Alternatively, if the child is resistant to

catecholamines, and vascular resistance is low, vasopressin p. 72 can be added.

Neonatal septic shock can be complicated by the transition from fetal to neonatal circulation. Treatment to reverse right ventricular failure, by decreasing pulmonary artery pressures, is commonly needed in neonates with fluid-refractory shock and persistent pulmonary hypertension of the newborn. Rapid administration of fluid in neonates with patent ductus arteriosus may cause left-to-right shunting and congestive heart failure induced by ventricular overload.

In *cardiogenic shock*, the aim is to improve cardiac output and to reduce the afterload on the heart. If central venous pressure is low, cautious volume expansion with a colloid or crystalloid can be used. An inotrope such as adrenaline/epinephrine or dopamine hydrochloride should be given to increase cardiac output. Dobutamine below is a peripheral vasodilator and is an alternative if hypotension is not significant.

Milrinone has both inotropic and vasodilatory effects and can be used when vascular resistance is high. Alternatively, glyceryl trinitrate or sodium nitroprusside (on specialist advice only) can be used to reduce vasoconstriction.

Hypovolaemic shock should be treated with a crystalloid or colloid solution (or whole or reconstituted blood if source of hypovolaemia is haemorrhage) and further steps to improve cardiac output and decrease vascular resistance can be taken, as in cardiogenic shock.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Antihistamines, allergen immunotherapy and allergic emergencies p. 186.

Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Ephedrine hydrochloride p. 136 is used to reverse hypotension caused by spinal and epidural anaesthesia.

Metaraminol p. 137 is used as a vasopressor during cardiopulmonary bypass.

Phenylephrine hydrochloride p. 138 causes peripheral vasoconstriction and increases arterial pressure.

Ephedrine hydrochloride, metaraminol and phenylephrine hydrochloride are rarely needed in children and should be used under specialist supervision.

Noradrenaline/norepinephrine is reserved for children with low systemic vascular resistance that is unresponsive to fluid resuscitation following septic shock, spinal shock, and anaphylaxis.

Adrenaline/epinephrine is mainly used for its inotropic action. Low doses (acting on beta receptors) cause systemic and pulmonary vasodilation, with some increase in heart rate and stroke volume and also an increase in contractility; high doses act predominantly on alpha receptors causing intense systemic vasoconstriction.

SYMPATHOMIMETICS › INOTROPIC

Dobutamine

11-Aug-2020

- **DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta$_1$ receptors in cardiac muscle, and increases contractility.

- **INDICATIONS AND DOSE**

Inotropic support in low cardiac output states, after cardiac surgery, cardiomyopathies, shock

▸ BY CONTINUOUS INTRAVENOUS INFUSION

▸ Neonate: Initially 5 micrograms/kg/minute, then adjusted according to response to 2–20 micrograms/kg/minute, doses as low as 0.5–1 microgram/kg/minute have been used.

▸ Child: Initially 5 micrograms/kg/minute, then adjusted according to response to 2–20 micrograms/kg/minute, doses as low as 0.5–1 microgram/kg/minute have been used

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Acute heart failure · acute myocardial infarction · arrhythmias · correct hypercapnia before starting and during treatment · correct hypovolaemia before starting and during treatment · correct hypoxia before starting and during treatment · correct metabolic acidosis before starting and during treatment · diabetes mellitus · extravasation may cause tissue necrosis · extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) · hyperthyroidism · ischaemic heart disease · occlusive vascular disease · severe hypotension · susceptibility to angle-closure glaucoma · tachycardia · tolerance may develop with continuous infusions longer than 72 hours
- **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic
- **SIDE-EFFECTS**

▸ **Common or very common** Arrhythmias · bronchospasm · chest pain · dyspnoea · eosinophilia · fever · inflammation localised · ischaemic heart disease · nausea · palpitations · platelet aggregation inhibition (on prolonged administration) · skin reactions · urinary urgency · vasoconstriction

▸ **Uncommon** Myocardial infarction

▸ **Rare or very rare** Atrioventricular block · cardiac arrest · coronary vasospasm · hypertension · hypokalaemia · hypotension

▸ **Frequency not known** Anxiety · cardiomyopathy · feeling hot · headache · myoclonus · paraesthesia · tremor

- **PREGNANCY** No evidence of harm in *animal* studies—manufacturers advise use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises dobutamine *injection* should be diluted before use or given undiluted with syringe pump. Dobutamine *concentrate* for intravenous infusion should be diluted before use.

For *continuous intravenous infusion*, manufacturer advises using infusion pump, dilute to a concentration of 0.5–1 mg/mL (max. 5 mg/mL if fluid restricted) with Glucose 5% *or* Sodium Chloride 0.9%; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.

▸ In neonates For *neonatal intensive care*, manufacturer advises dilute 30 mg/kg body-weight to a final volume of 50 mL with Glucose 5% *or* Sodium Chloride 0.9%; an intravenous infusion rate of 0.5 mL/hour provides a dose of

5 micrograms/kg/minute; max. concentration of 5 mg/mL; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

EXCIPIENTS: May contain Sulfites

- **Dobutamine (Non-proprietary)**

Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 ml Dobutamine 250mg/50ml solution for infusion vials | 1 vial PoM £11.20

Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 ml Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 10 ampoule PoM £56.00–£63.50 | 10 ampoule PoM £52.50 (Hospital only)

Dopamine hydrochloride

22-Feb-2021

- **DRUG ACTION** Dopamine is a cardiac stimulant which acts on beta$_1$ receptors in cardiac muscle, and increases contractility with little effect on rate.

- **INDICATIONS AND DOSE**

To correct the haemodynamic imbalance due to acute hypotension, shock, cardiac failure, adjunct following cardiac surgery

- BY CONTINUOUS INTRAVENOUS INFUSION
- Neonate: Initially 3 micrograms/kg/minute (max. per dose 20 micrograms/kg/minute), adjusted according to response.
- Child: Initially 5 micrograms/kg/minute (max. per dose 20 micrograms/kg/minute), adjusted according to response

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS** Phaeochromocytoma · tachyarrhythmia
- **CAUTIONS** Correct hypovolaemia · hypertension (may raise blood pressure) · hyperthyroidism
- **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic
- **SIDE-EFFECTS** Angina pectoris · anxiety · arrhythmias · azotaemia · cardiac conduction disorder · dyspnoea · gangrene · headache · hypertension · mydriasis · nausea · palpitations · piloerection · polyuria · tremor · vasoconstriction · vomiting
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation—not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** EvGr Dopamine concentrate for intravenous infusion to be diluted before use; give via a large vein.

For *continuous intravenous infusion*, dilute to a max. concentration of 3.2 mg/mL with Glucose 5% *or* Sodium Chloride 0.9%. M Expert sources advise infuse higher concentrations through central venous catheter using a syringe pump to avoid extravasation. Incompatible with bicarbonate and other alkaline solutions.

- In neonates *Neonatal intensive care*, expert sources advise dilute 30 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.3 mL/hour provides a dose of 3 micrograms/kg/minute. EvGr Max. concentration of 3.2 mg/mL. M Expert sources advise infuse higher concentrations through central venous catheter using a syringe pump. Incompatible with bicarbonate and other alkaline solutions.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

- **Dopamine hydrochloride (Non-proprietary)**

Dopamine hydrochloride 40 mg per 1 ml Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule PoM £20.00 (Hospital only) | 10 ampoule PoM £14.78 | 10 ampoule PoM £14.78 (Hospital only)

Dopamine 200mg/5ml concentrate for solution for infusion ampoules | 10 ampoule PoM ∑ (Hospital only)

SYMPATHOMIMETICS › VASOCONSTRICTOR

Ephedrine hydrochloride

29-Mar-2022

- **INDICATIONS AND DOSE**

Reversal of hypotension from spinal or epidural anaesthesia

- BY SLOW INTRAVENOUS INJECTION
- Child 1 month–11 years: 500–750 micrograms/kg every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 30 mg/mL, alternatively 17–25 mg/m^2 every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 30 mg/mL; maximum 30 mg per course
- Child 12–17 years: 3–7.5 mg every 3–4 minutes (max. per dose 9 mg), adjusted according to response; maximum 30 mg per course

- **CAUTIONS** Diabetes mellitus · hypertension · hyperthyroidism · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
- **Common or very common** Anxiety · arrhythmias · asthenia · confusion · depression · dyspnoea · headache · hyperhidrosis · insomnia · irritability · nausea · palpitations · vomiting
- **Rare or very rare** Acute urinary retention
- **Frequency not known** Acute angle closure glaucoma · angina pectoris · appetite decreased · cardiac arrest · dizziness · hypokalaemia · intracranial haemorrhage · psychotic disorder · pulmonary oedema · tremor
- **PREGNANCY** Increased fetal heart rate reported with parenteral ephedrine.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- **Ephedrine hydrochloride (Non-proprietary)**

Ephedrine hydrochloride 3 mg per 1 ml Ephedrine 30mg/10ml solution for injection ampoules | 10 ampoule PoM £124.09

Ephedrine 30mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £9.50 DT = £9.50 | 12 pre-filled disposable injection PoM £114.00

Ephedrine hydrochloride 30 mg per 1 ml Ephedrine 30mg/1ml solution for injection ampoules | 10 ampoule PoM £62.62–£95.03 DT = £82.33

Metaraminol

28-Apr-2020

● **INDICATIONS AND DOSE**

Emergency treatment of acute hypotension

► INITIALLY BY INTRAVENOUS INJECTION

- Child 12–17 years: Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response

Acute hypotension

► BY INTRAVENOUS INFUSION

- Child 12–17 years: 15–100 mg, adjusted according to response

● **CAUTIONS** Cirrhosis · coronary vascular thrombosis · diabetes mellitus · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hypertension · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · susceptibility to angle-closure glaucoma · uncorrected hypovolaemia

CAUTIONS, FURTHER INFORMATION

- Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.

● **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

● **SIDE-EFFECTS**

► **Common or very common** Headache · hypertension

► **Rare or very rare** Skin exfoliation · soft tissue necrosis

► **Frequency not known** Abscess · arrhythmias · nausea · palpitations · peripheral ischaemia

● **PREGNANCY** May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute to a concentration of 30–200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- Metaraminol (Non-proprietary)

Metaraminol (as Metaraminol tartrate) 500 microgram per 1 ml Metaraminol 2.5mg/5ml solution for injection ampoules | 10 ampoule PoM £37.40 (Hospital only)
Metaraminol 5mg/10ml solution for injection ampoules | 10 ampoule PoM £76.10 (Hospital only)
Metaraminol 2.5mg/5ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £95.00 (Hospital only)
Metaraminol 5mg/10ml solution for injection vials | 10 vial PoM £55.00 (Hospital only)

Metaraminol (as Metaraminol tartrate) 10 mg per 1 ml Metaraminol 10mg/1ml solution for injection vials | 10 vial PoM £20.50 (Hospital only)
Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule PoM £21.50

Noradrenaline/norepinephrine

13-May-2020

● **INDICATIONS AND DOSE**

Acute hypotension (septic shock) | **Shock secondary to excessive vasodilation**

► BY CONTINUOUS INTRAVENOUS INFUSION

- Neonate: 20–100 nanograms/kg/minute (max. per dose 1 microgram/kg/minute), adjusted according to response, dilute the 1 mg/mL concentrate for infusion for this dose.
- Child: 20–100 nanograms/kg/minute (max. per dose 1 microgram/kg/minute), adjusted according to response, dilute the 1 mg/mL concentrate for infusion for this dose

DOSE EQUIVALENCE AND CONVERSION

- 1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. **Doses expressed as the base.**

● **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

ASSOCIATION OF NORADRENALINE/NOREPINEPHRINE 0.08 MG/ML (4 MG IN 50 ML) AND 0.16 MG/ML (8 MG IN 50 ML) SOLUTION FOR INFUSION WITH POTENTIAL RISK OF MEDICATION ERRORS

Healthcare professionals should be aware of the differences in strength and presentation between noradrenaline/norepinephrine products—manufacturer advises noradrenaline 0.08 mg/mL solution for infusion and noradrenaline 0.16 mg/mL solution for infusion must **not** be diluted before use and should only be used for the on-going treatment of patients already established on noradrenaline therapy, whose dose requirements are clinically confirmed to be escalating.

● **CONTRA-INDICATIONS** Hypertension

● **CAUTIONS** Coronary vascular thrombosis · diabetes mellitus · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · susceptibility to angle-closure glaucoma · uncorrected hypovolaemia

● **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

● **SIDE-EFFECTS** Acute glaucoma · anxiety · arrhythmias · asthenia · cardiomyopathy · confusion · dyspnoea · extravasation necrosis · gangrene · headache · heart failure · hypovolaemia · hypoxia · injection site necrosis · insomnia · ischaemia · myocardial contractility increased · nausea · palpitations · peripheral ischaemia · psychotic disorder · respiratory failure · tremor · urinary retention · vomiting

● **PREGNANCY** Manufacturer advises use if potential benefit outweighs risk—may reduce placental perfusion and induce fetal bradycardia.

● **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.

● **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, using 1 mg/mL concentrate for infusion, dilute to a max. concentration of noradrenaline (base) 40 micrograms/mL (higher concentrations can be used if fluid-restricted) with Glucose 5% or Sodium Chloride and Glucose. Infuse through central venous catheter; discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

For *neonatal intensive care*, using 1 mg/mL concentrate for infusion, dilute 600 micrograms (base)/kg body-weight to a final volume of 50 mL with infusion fluid; an

intravenous infusion rate of 0.1 mL/hour provides a dose of 20 nanograms (base)/kg/minute; infuse through central venous catheter; max. concentration of noradrenaline (base) 40 micrograms/mL (higher concentrations can be used if fluid-restricted). Discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

- **PRESCRIBING AND DISPENSING INFORMATION** For a period of time, preparations on the UK market may be described as either noradrenaline base or noradrenaline acid tartrate; doses in BNF Publications are expressed as the base.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for infusion

- **Noradrenaline/norepinephrine (Non-proprietary)**

Noradrenaline (as Noradrenaline acid tartrate) 80 microgram per 1 ml Noradrenaline (base) 4mg/50ml solution for infusion vials | 10 vial PoM (Hospital only)

Noradrenaline (as Noradrenaline acid tartrate) 1 mg per 1 ml Noradrenaline (base) 1mg/1ml concentrate for solution for infusion ampoules | 10 ampoule PoM (Hospital only)

Noradrenaline (base) 8mg/8ml concentrate for solution for infusion ampoules | 10 ampoule PoM £116.00 (Hospital only)

Noradrenaline (base) 2mg/2ml solution for infusion ampoules | 5 ampoule PoM £12.00 (Hospital only)

Noradrenaline (base) 10mg/10ml concentrate for solution for infusion ampoules | 10 ampoule PoM (Hospital only)

- **Sinora** (Sintetica Ltd)

Noradrenaline (as Noradrenaline acid tartrate) 80 microgram per 1 ml Sinora 4mg/50ml solution for infusion vials | 1 vial PoM £9.97 (Hospital only)

Noradrenaline (as Noradrenaline acid tartrate) 160 microgram per 1 ml Sinora 8mg/50ml solution for infusion vials | 1 vial PoM £14.22 (Hospital only)

Phenylephrine hydrochloride

- **INDICATIONS AND DOSE**

Acute hypotension

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child 1-11 years: 100 micrograms/kg every 1–2 hours (max. per dose 5 mg) as required
- Child 12-17 years: Initially 2–5 mg (max. per dose 5 mg), followed by 1–10 mg, after at least 15 minutes if required
- BY SLOW INTRAVENOUS INJECTION
- Child 1-11 years: Initially 5–20 micrograms/kg (max. per dose 500 micrograms), repeated as necessary after at least 15 minutes
- Child 12-17 years: 100–500 micrograms, repeated as necessary after at least 15 minutes
- BY INTRAVENOUS INFUSION
- Child 1-15 years: Initially 100–500 nanograms/kg/minute, adjusted according to response
- Child 16-17 years: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

- **UNLICENSED USE** Not licensed for use in children by intravenous infusion or injection.
- **CONTRA-INDICATIONS** Hypertension · severe hyperthyroidism
- **CAUTIONS** Coronary disease · coronary vascular thrombosis · diabetes · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · susceptibility to angle-closure glaucoma · uncorrected hypovolaemia

CAUTIONS, FURTHER INFORMATION

- Hypertensive response Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an excessive vasopressor response may cause a prolonged rise in blood pressure.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Angina pectoris · arrhythmias · cardiac arrest · dizziness · dyspnoea · flushing · glucose tolerance impaired · headache · hyperhidrosis · hypersalivation · hypotension · intracranial haemorrhage · metabolic change · mydriasis · palpitations · paraesthesia · peripheral coldness · pulmonary oedema · soft tissue necrosis · syncope · urinary disorders · vomiting
- **PREGNANCY** Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.
- **MONITORING REQUIREMENTS** Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, dilute to a concentration of 1 mg/mL with Water for Injections and administer slowly. For *intravenous infusion*, dilute to a concentration of 20 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% and administer as a continuous infusion via a central venous catheter using a controlled infusion device.
- **PRESCRIBING AND DISPENSING INFORMATION** Intravenous administration preferred when managing acute hypotension in children.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- **Phenylephrine hydrochloride (Non-proprietary)**

Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 ml Phenylephrine 500micrograms/10ml solution for injection pre-filled syringes | 10 pre-filled disposable injection PoM £150.00 (Hospital only)

BETA-ADRENOCEPTOR BLOCKERS › ALPHA- AND BETA-ADRENOCEPTOR BLOCKERS

115

Carvedilol

10-Mar-2020

● **INDICATIONS AND DOSE**

Adjunct in heart failure (limited information available)

► BY MOUTH

- Child 2–17 years: Initially 50 micrograms/kg twice daily (max. per dose 3.125 mg) for at least 2 weeks, then increased to 100 micrograms/kg twice daily for at least 2 weeks, then increased to 200 micrograms/kg twice daily, then increased if necessary up to 350 micrograms/kg twice daily (max. per dose 25 mg)

● **UNLICENSED USE** Not licensed for use in children under 18 years.

● **CONTRA-INDICATIONS** Acute or decompensated heart failure requiring intravenous inotropes

● **INTERACTIONS** → Appendix 1: beta blockers, non-selective

● **SIDE-EFFECTS**

► **Common or very common** Anaemia · asthma · dyspepsia · eye irritation · fluid imbalance · genital oedema · hypercholesterolaemia · hyperglycaemia · hypoglycaemia · increased risk of infection · oedema · postural hypotension · pulmonary oedema · renal impairment · urinary disorders · weight increased

► **Uncommon** Alopecia · angina pectoris · constipation · hyperhidrosis · skin reactions

► **Rare or very rare** Dry mouth · hypersensitivity · leucopenia · nasal congestion · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

● **PREGNANCY** Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

● **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
Dose adjustments Manufacturer advises dose adjustment may be required in moderate impairment.

● **MONITORING REQUIREMENTS** Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

● **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Carvedilol for heart failure
www.medicinesforchildren.org.uk/medicines/carvedilol-for-heart-failure/

DIURETICS › POTASSIUM-SPARING DIURETICS › ALDOSTERONE ANTAGONISTS

Potassium canrenoate

11-Dec-2020

● **INDICATIONS AND DOSE**

Short-term diuresis for oedema in heart failure and in ascites

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate: 1–2 mg/kg twice daily.
- Child 1 month–11 years: 1–2 mg/kg twice daily
- Child 12–17 years: 1–2 mg/kg twice daily (max. per dose 200 mg)

DOSE EQUIVALENCE AND CONVERSION

- To convert to equivalent oral spironolactone dose, multiply potassium canrenoate dose by 0.7.

● **UNLICENSED USE** Not licensed for use in the UK.

● **CONTRA-INDICATIONS** Hyperkalaemia · hyponatraemia

● **CAUTIONS** Acute porphyrias p. 688 · hypotension · *rodent* studies indicate potential carcinogenic risk

● **INTERACTIONS** → Appendix 1: potassium canrenoate

● **SIDE-EFFECTS**

► **Common or very common** Ataxia · drowsiness · headache · hyperuricaemia · menstruation irregular

► **Uncommon** Electrolyte imbalance · eosinophilia · thrombocytopenia

► **Rare or very rare** Agranulocytosis · alopecia · hepatotoxicity · hypersensitivity · osteomalacia · skin reactions · voice alteration

► **Frequency not known** Acidosis hyperchloraemic · breast pain · confusion (transient; with high doses) · gastrointestinal disorder · gynaecomastia · hirsutism · hypotension

● **PREGNANCY** Crosses placenta. Feminisation and undescended testes in male fetus in *animal* studies—manufacturer advises avoid.

● **BREAST FEEDING** Present in breast milk—manufacturer advises avoid.

● **RENAL IMPAIRMENT** Use with caution if estimated glomerular filtration rate 30–60 mL/minute/1.73 m^2. Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m^2.
Monitoring Monitor plasma-potassium concentration if estimated glomerular filtration rate 30–60 mL/minute/1.73 m^2.

● **MONITORING REQUIREMENTS** Monitor electrolytes (discontinue if hyperkalaemia occurs).

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, manufacturer advises give over 2–3 minutes (consult product literature).

● **PRESCRIBING AND DISPENSING INFORMATION** Potassium canrenoate injection is available from 'special-order' manufacturers or specialist importing companies.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Potassium canrenoate (Non-proprietary)**

Potassium canrenoate 20 mg per 1 ml Aldactone 200mg/10ml solution for injection ampoules | 10 ampoule PoM (Hospital only)

Spironolactone

11-Dec-2020

● **INDICATIONS AND DOSE**

Oedema in heart failure and in ascites | Nephrotic syndrome | Reduction of hypokalaemia induced by diuretics or amphotericin B

▸ BY MOUTH

- Neonate: Initially 1–2 mg/kg daily in 1–2 divided doses; increased if necessary up to 7 mg/kg daily, in resistant ascites.
- Child 1 month–11 years: Initially 1–3 mg/kg daily in 1–2 divided doses; increased if necessary up to 9 mg/kg daily, in resistant ascites
- Child 12–17 years: Initially 50–100 mg daily in 1–2 divided doses; increased if necessary up to 9 mg/kg daily, in resistant ascites; maximum 400 mg per day

● **UNLICENSED USE** Not licensed for reduction of hypokalaemia induced by diuretics or amphotericin B.

● **CONTRA-INDICATIONS** Addison's disease · anuria · hyperkalaemia

● **CAUTIONS** Acute porphyrias p. 688 · *rodent* studies indicate potential carcinogenic risk

● **INTERACTIONS** → Appendix 1: aldosterone antagonists

● **SIDE-EFFECTS** Acidosis hyperchloraemic · acute kidney injury · agranulocytosis · alopecia · breast neoplasm benign · breast pain · confusion · dizziness · electrolyte imbalance · gastrointestinal disorder · gynaecomastia · hepatic function abnormal · hyperkalaemia (discontinue) · hypertrichosis · leg cramps · leucopenia · libido disorder · malaise · menstrual disorder · nausea · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia

● **PREGNANCY** Use only if potential benefit outweighs risk—feminisation of male fetus in *animal* studies.

● **BREAST FEEDING** Metabolites present in milk, but amount probably too small to be harmful.

● **RENAL IMPAIRMENT** Avoid in acute renal insufficiency or severe impairment.
Monitoring Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

● **MONITORING REQUIREMENTS** Monitor electrolytes—discontinue if hyperkalaemia occurs.

● **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of spironolactone is required, the following strength is used: 50 mg/5 mL.

● **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Spironolactone for heart failure
www.medicinesforchildren.org.uk/medicines/spironolactone-for-heart-failure/

Enoximone

24-Jun-2021

● **DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

● **INDICATIONS AND DOSE**

Congestive heart failure, low cardiac output following cardiac surgery

▸ INITIALLY BY SLOW INTRAVENOUS INJECTION

- Neonate: Loading dose 500 micrograms/kg, followed by (by continuous intravenous infusion) 5–20 micrograms/kg/minute, adjusted according to response, infusion to be given over 24 hours; maximum 24 mg/kg per day.
- Child: Loading dose 500 micrograms/kg, followed by (by continuous intravenous infusion) 5–20 micrograms/kg/minute, adjusted according to response, infusion dose to be given over 24 hours; maximum 24 mg/kg per day

● **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

● **SIDE-EFFECTS**

▸ **Common or very common** Headache · hypotension · insomnia

▸ **Uncommon** Arrhythmias · diarrhoea · dizziness · nausea · vomiting

▸ **Rare or very rare** Chills · fever · fluid retention · myalgia · oliguria · urinary retention

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **RENAL IMPAIRMENT**
Dose adjustments In adults, manufacturer advises consider dose reduction (consult product literature).

● **MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

● **DIRECTIONS FOR ADMINISTRATION** Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.
For *intravenous administration*, dilute to concentration of 2.5 mg/mL with Sodium Chloride 0.9% or Water for Injections; the initial loading dose should be given by slow intravenous injection over at least 15 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION**
Phosphodiesterase type-3 inhibitors possess positive inotropic and vasodilator activity and are useful in infants and children with low cardiac output especially after cardiac surgery. Phosphodiesterase type-3 inhibitors should be limited to short-term use because long-term oral administration has been associated with increased mortality in adults with congestive heart failure.

● **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Enoximone for pulmonary hypertension www.medicinesforchildren.org.uk/medicines/enoximone-for-pulmonary-hypertension/

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

▸ **Perfan** (Carinopharm GmbH)
Enoximone 5 mg per 1 ml Perfan 100mg/20ml solution for injection ampoules | 10 ampoule PoM ⚠ (Hospital only)

Milrinone

27-Jan-2020

● **DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

● **INDICATIONS AND DOSE**

Congestive heart failure, low cardiac output following cardiac surgery, shock

▸ INITIALLY BY INTRAVENOUS INFUSION

▸ Neonate: Initially 50–75 micrograms/kg, given over 30-60 minutes, reduce or omit initial dose if at risk of hypotension, then (by continuous intravenous infusion) 30–45 micrograms/kg/hour for 2–3 days (usually for 12 hours after cardiac surgery).

▸ Child: Initially 50–75 micrograms/kg, given over 30-60 minutes, reduce or omit initial dose if at risk of hypotension, then (by continuous intravenous infusion) 30–45 micrograms/kg/hour for 2–3 days (usually for 12 hours after cardiac surgery)

● **UNLICENSED USE** Not licensed for use in children under 18 years.

● **CONTRA-INDICATIONS** Severe hypovolaemia

● **CAUTIONS** Correct hypokalaemia · heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

● **SIDE-EFFECTS**

▸ **Common or very common** Arrhythmia supraventricular (increased risk in patients with pre-existing arrhythmias) · arrhythmias · headache · hypotension

▸ **Uncommon** Angina pectoris · chest pain · hypokalaemia · thrombocytopenia · tremor

▸ **Rare or very rare** Anaphylactic shock · bronchospasm · skin eruption

▸ **Frequency not known** Intraventricular haemorrhage · renal failure

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT**
Dose adjustments Use half to three-quarters normal dose and monitor response if estimated glomerular filtration rate less than 50 mL/minute/1.73 m^2.

● **MONITORING REQUIREMENTS**

▸ Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

▸ Monitor renal function.

● **DIRECTIONS FOR ADMINISTRATION** Avoid extravasation.
For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9% *or* Sodium Chloride and Glucose intravenous infusion to a concentration of 200 micrograms/mL (higher concentrations of 400 micrograms/mL have been used).
Loading dose may be given undiluted if fluid-restricted.

● **PRESCRIBING AND DISPENSING INFORMATION**
Phosphodiesterase type-3 inhibitors possess positive inotropic and vasodilator activity and are useful in infants and children with low cardiac output especially after cardiac surgery. Phosphodiesterase type-3 inhibitors should be limited to short-term use because long-term oral administration has been associated with increased mortality in adults with congestive heart failure.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

6 Hyperlipidaemia

Dyslipidaemias

23-Mar-2018

Cardiovascular disease risk factors

Atherosclerosis begins in childhood and raised serum cholesterol in children is associated with cardiovascular disease in adulthood. Lowering the cholesterol, without hindering growth and development in children and adolescents, should reduce the risk of cardiovascular disease in later life.

The risk factors for developing cardiovascular disease include raised serum cholesterol concentration, smoking, hypertension, impaired glucose tolerance, male sex, ethnicity, obesity, triglyceride concentration, chronic kidney disease, and a family history of cardiovascular disease. Heterozygous familial hypercholesterolaemia is the most common cause of raised serum cholesterol in children; homozygous familial hypercholesterolaemia is very rare and its specialised management is not covered in *BNF for Children*. EvGr Familial hypercholesterolaemia can lead to a greater risk of early coronary heart disease and should be managed by a specialist. A

Secondary causes of hypercholesterolaemia should be addressed, these include obesity, diet, diabetes mellitus, hypothyroidism, nephrotic syndrome, obstructive biliary disease, glycogen storage disease, and drugs such as corticosteroids.

Management

The aim of management of hypercholesterolaemia is to reduce the risk of atherosclerosis while ensuring adequate growth and development. Children with hypercholesterolaemia (or their carers) should receive advice on appropriate lifestyle changes such as improved diet, increased exercise, weight reduction, and Smoking cessation p. 330; Hypertension p. 110 should also be managed appropriately. Drug therapy may also be necessary.

Hypothyroidism

Children with hypothyroidism should receive adequate thyroid replacement therapy before their requirement for lipid-regulating treatment is assessed because correction of hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

Heterozygous familial hypercholesterolaemia

In heterozygous familial hypercholesterolaemia, drug treatment is often required as lifestyle modifications alone are unlikely to sufficiently lower cholesterol concentration. EvGr Treatment with lipid-regulating drugs should be considered by the age of 10 years, although the decision to initiate or defer treatment will depend on the child's age, the age of onset of coronary heart disease within the family, and the presence of other cardiovascular risk factors. Lipid-regulating drug treatment before the age of 10 years, or a higher dose of statin than licensed for use in the appropriate age group, or a combination of lipid-regulating drugs should be considered in children with a family history of coronary heart disease in early adulthood.

Statins are the lipid-regulating drug of choice and treatment should be life-long. In children who are intolerant to statins, ezetimibe p. 143, fibrates, or bile acid sequestrants should be considered as alternative options. Vitamins A, D and K, and folic acid supplementation can be given to patients on long-term bile acid sequestrants. A

Secondary hypercholesterolaemia

Drug treatment may be indicated in children 10 years and older (rarely necessary in younger children) who are at a high risk of developing cardiovascular disease if 6–12 months of dietary and other lifestyle interventions have failed to lower cholesterol concentration adequately.

Lipid-regulating drugs

Experience in the use of lipid-regulating drugs in children is limited and they should be initiated on specialist advice.

Statins are more effective than other classes of drugs in lowering LDL-cholesterol but less effective than the fibrates in reducing triglycerides. Statins also increase concentrations of HDL-cholesterol. Statins reduce cardiovascular disease events and total mortality in adults, irrespective of the initial cholesterol concentration. They are the drugs of first choice in children and are generally well tolerated; atorvastatin p. 145 and simvastatin p. 147 are the preferred statins. Other lipid-regulating drugs can be used if statins are ineffective or are not tolerated.

Ezetimibe can be used alone when statins are not tolerated, or in combination with a statin when a high dose statin fails to control cholesterol concentration adequately.

Bile acid sequestrants are also available but tolerability of and compliance with these drugs is poor, and their use is declining.

Fibrates may reduce the risk of coronary heart disease in those with low HDL-cholesterol or with raised triglycerides. Evidence for the use of a fibrate (bezafibrate p. 143 or fenofibrate p. 143) in children is limited; fibrates should be considered only if dietary intervention and treatment with a statin and a bile acid sequestrant is unsuccessful or contra-indicated.

Evolocumab p. 148 is licensed for the treatment of homozygous familial hypercholesterolaemia; it is used in combination with other lipid-lowering therapies.

In hypertriglyceridaemia which cannot be controlled by very strict diet, omega-3 fatty acid compounds can be considered.

LIPID MODIFYING DRUGS › BILE ACID SEQUESTRANTS

Bile acid sequestrants

- **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.
- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).
- **SIDE-EFFECTS**
  - **Common or very common** Constipation · gastrointestinal discomfort · headache · nausea · vomiting
  - **Uncommon** Appetite decreased · diarrhoea · gastrointestinal disorders
- **PREGNANCY** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- **BREAST FEEDING** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- **MONITORING REQUIREMENTS** A child's growth and development should be monitored.

Colestipol hydrochloride

20-Jul-2020

- **INDICATIONS AND DOSE**

Familial hypercholesterolaemia

- BY MOUTH
  - Child 12–17 years: Initially 5 g 1–2 times a day, then increased in steps of 5 g every month, total daily dose may be given in 1–2 divided doses or as a single dose if tolerated; maximum 30 g per day

- **UNLICENSED USE** Not licensed for use in children.
- **INTERACTIONS** → Appendix 1: colestipol
- **SIDE-EFFECTS** Angina pectoris · arthralgia · arthritis · asthenia · burping · chest pain · dizziness · dyspnoea · gallbladder disorders · headaches · inflammation · insomnia · pain · peptic ulcer haemorrhage · tachycardia
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice or skimmed milk; alternatively it can be mixed with thin soups, cereals, yoghurt, or pulpy fruits ensuring at least 100 mL of liquid is provided.
- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestipol hydrochloride granules (avoid other drugs at same time).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Granules

Colestyramine

(Cholestyramine)

20-Jul-2020

- **INDICATIONS AND DOSE**

Familial hypercholesterolaemia

- BY MOUTH
  - Child 6–11 years: Initially 4 g once daily, then increased to 4 g up to 3 times a day, adjusted according to response

- Child 12–17 years: Initially 4 g once daily, then increased in steps of 4 g every week; increased to 12–24 g daily in 1–4 divided doses, adjusted according to response; maximum 36 g per day

Pruritus associated with partial biliary obstruction and primary biliary cirrhosis

- BY MOUTH
- Child 1–11 months: 1 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 9 g per day
- Child 1–5 years: 2 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 18 g per day
- Child 6–11 years: 4 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 24 g per day
- Child 12–17 years: 4–8 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 36 g per day

Diarrhoea associated with Crohn's disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation

- BY MOUTH
- Child 1–11 months: 1 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 9 g per day
- Child 1–5 years: 2 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 18 g per day
- Child 6–11 years: 4 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 24 g per day
- Child 12–17 years: 4–8 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 36 g per day

- **CONTRA-INDICATIONS** Complete biliary obstruction (not likely to be effective)
- **INTERACTIONS** → Appendix 1: colestyramine
- **SIDE-EFFECTS**
- **Uncommon** Acidosis hyperchloraemic · bleeding tendency · hypoprothrombinaemia · night blindness · osteoporosis · skin reactions · tongue irritation · vitamin deficiencies
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content.
- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Powder

LIPID MODIFYING DRUGS › CHOLESTEROL ABSORPTION INHIBITORS

Ezetimibe

13-Mar-2019

- **DRUG ACTION** Ezetimibe inhibits the intestinal absorption of cholesterol.

- **INDICATIONS AND DOSE**

Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia | Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia | Primary hypercholesterolaemia (if statin inappropriate or not tolerated) | Adjunct to dietary measures in homozygous sitosterolaemia

- BY MOUTH
- Child 10–17 years: 10 mg daily

- **INTERACTIONS** → Appendix 1: ezetimibe
- **SIDE-EFFECTS**
- **Common or very common** Asthenia · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders
- **Uncommon** Appetite decreased · arthralgia · chest pain · cough · hot flush · hypertension · muscle complaints · nausea · pain
- **Frequency not known** Constipation · depression · dizziness · dyspnoea · hepatitis · myopathy · pancreatitis · paraesthesia · skin reactions · thrombocytopenia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Ezetimibe (Non-proprietary)**
  Ezetimibe 10 mg Ezetimibe 10mg tablets | 28 tablet PoM £26.31 DT = £1.39
- **Ezetrol** (Organon Pharma (UK) Ltd)
  Ezetimibe 10 mg Ezetrol 10mg tablets | 28 tablet PoM £26.31 DT = £1.39

Combinations available: ***Simvastatin with ezetimibe***, p. 148

LIPID MODIFYING DRUGS › FIBRATES

Bezafibrate

09-Aug-2021

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholestrol.

- **INDICATIONS AND DOSE**

Hyperlipidaemia including familial hypercholesterolaemia (administered on expert advice)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 10–17 years: 200 mg once daily (max. per dose 200 mg 3 times a day), adjusted according to response

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates
- **CAUTIONS** Correct hypothyroidism before initiating treatment · risk factors for myopathy
- **INTERACTIONS** → Appendix 1: fibrates
- **SIDE-EFFECTS**
- **Common or very common** Appetite decreased · gastrointestinal disorder
- **Uncommon** Acute kidney injury · alopecia · cholestasis · constipation · diarrhoea · dizziness · erectile dysfunction ·

gastrointestinal discomfort · headache · muscle complaints · muscle weakness · nausea · photosensitivity reaction · skin reactions

▸ **Rare or very rare** Cholelithiasis · depression · insomnia · interstitial lung disease · pancreatitis · pancytopenia · paraesthesia · peripheral neuropathy · rhabdomyolysis (increased risk in renal impairment) · severe cutaneous adverse reactions (SCARs) · thrombocytopenic purpura

- **PREGNANCY** Manufacturers advise avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in significant impairment (except in fatty liver disease).
- **RENAL IMPAIRMENT** Manufacturer advises avoid *immediate-release* preparations if creatinine clearance less than 15 mL/minute. Manufacturer advises avoid *modified-release* preparations if creatinine clearance less than 60 mL/minute.
  Myotoxicity Manufacturer advises special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.
  Dose adjustments See p. 15.
  In adults, manufacturer advises reduce dose if creatinine clearance 15–60 mL/minute (consult product literature).
- **MONITORING REQUIREMENTS** Consider monitoring of liver function and creatine kinase when fibrates used in combination with a statin.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  Tablet
  CAUTIONARY AND ADVISORY LABELS 21
  ▸ **Bezalip** (Teva UK Ltd)
  Bezafibrate 200 mg Bezalip 200mg tablets | 100 tablet PoM £8.63 DT = £8.63

Fenofibrate

09-Aug-2021

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

- **INDICATIONS AND DOSE**

Hyperlipidaemias including familial hypercholesterolaemia (administered on expert advice)

▸ BY MOUTH USING CAPSULES

▸ Child 4-14 years: One 67 mg (micronised) capsule per 20 kg body-weight daily, maximum four 67 mg capsules daily, or max. three 67 mg capsules daily with concomitant statin

▸ Child 15-17 years: Initially 3 capsules daily, then increased if necessary to 4 capsules daily, max. 3 capsules daily with concomitant statin, dose relates to 67 mg (micronised) capsules

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▸ Manufacturer advises max. dose 200 mg daily with concurrent use of a statin—no specific recommendation made for children.

- **UNLICENSED USE** 200 mg and 267 mg capsules not licensed in children. Tablets not licensed in children.
- **CONTRA-INDICATIONS** Gall bladder disease · pancreatitis (unless due to severe hypertriglyceridaemia) · photosensitivity to fibrates · photosensitivity to ketoprofen
- **CAUTIONS** Correct hypothyroidism before initiating treatment · risk factors for myopathy
- **INTERACTIONS** → Appendix 1: fibrates
- **SIDE-EFFECTS**

▸ **Common or very common** Abdominal pain · diarrhoea · flatulence · nausea · vomiting

▸ **Uncommon** Cholelithiasis · embolism and thrombosis · headache · muscle complaints · muscle weakness · myopathy · pancreatitis · sexual dysfunction · skin reactions

▸ **Rare or very rare** Alopecia · hepatic disorders · photosensitivity reaction

▸ **Frequency not known** Fatigue · interstitial lung disease · rhabdomyolysis (increased risk in renal impairment) · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Avoid—embryotoxicity in *animal* studies.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid —no information available.
- **RENAL IMPAIRMENT** EvGr Use with caution in mild-to-moderate impairment; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m^2. Ⓜ
  Myotoxicity EvGr Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly. Ⓜ
  Dose adjustments See p. 15.
  EvGr Max. 67 mg daily if estimated glomerular filtration rate 30–59 mL/minute/1.73 m^2. Ⓜ
- **MONITORING REQUIREMENTS** Manufacturer advises monitor hepatic transaminases every 3 months during the first 12 months of treatment and periodically thereafter—discontinue treatment if levels increase to more than 3 times the upper limit of normal; monitor serum creatinine levels during the first 3 months of treatment and periodically thereafter—interrupt treatment if creatinine level is 50% above the upper limit of normal.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

LIPID MODIFYING DRUGS › STATINS

Statins

- **DRUG ACTION** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an

enzyme involved in cholesterol synthesis, especially in the liver.

- **CAUTIONS** High alcohol intake · history of liver disease · hypothyroidism · known genetic polymorphisms—consult product literature · patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

CAUTIONS, FURTHER INFORMATION

- **Muscle effects** Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

  In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).
- **Hypothyroidism** Hypothyroidism should be managed adequately before starting treatment with a statin.

- **SIDE-EFFECTS**
- **Common or very common** Asthenia · constipation · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · myalgia · nausea · sleep disorders · thrombocytopenia
- **Uncommon** Alopecia · hepatic disorders · memory loss · pancreatitis · paraesthesia · sexual dysfunction · skin reactions · vomiting
- **Rare or very rare** Myopathy · peripheral neuropathy · tendinopathy
- **Frequency not known** Depression · diabetes mellitus (in those at risk) · interstitial lung disease

SIDE-EFFECTS, FURTHER INFORMATION **Muscle effects**

The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely.

Interstitial lung disease If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

- **CONCEPTION AND CONTRACEPTION** Adequate contraception is required during treatment and for 1 month afterwards.
- **PREGNANCY** Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (risk of increased exposure); avoid in active disease or unexplained persistent elevations in serum transaminases.
- **MONITORING REQUIREMENTS**
- Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.
- **Liver function** There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease).

  Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should **not** be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.
- **Creatine kinase** Creatine kinase concentration should be measured in children before treatment and if unexplained muscle pain occurs.

- **PATIENT AND CARER ADVICE** Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

F 144

Atorvastatin

13-May-2022

- **INDICATIONS AND DOSE**

Hyperlipidaemia including familial hypercholesterolaemia

- BY MOUTH
- Child 10–17 years: Initially 10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be adjusted at intervals of at least 4 weeks

Homozygous familial hypercholesterolaemia

- BY MOUTH
- Child 10–17 years: Initially 10 mg once daily, then increased if necessary up to 80 mg once daily, dose to be adjusted at intervals of at least 4 weeks

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises if concurrent use of ciclosporin is unavoidable, max. dose cannot exceed 10 mg daily.

- **CAUTIONS** Haemorrhagic stroke
- **INTERACTIONS** → Appendix 1: statins
- **SIDE-EFFECTS**
- **Common or very common** Epistaxis · hyperglycaemia · hypersensitivity · joint disorders · laryngeal pain · muscle complaints · nasopharyngitis · pain
- **Uncommon** Appetite decreased · burping · chest pain · fever · hypoglycaemia · malaise · numbness · peripheral oedema · taste altered · tinnitus · vision disorders · weight increased
- **Rare or very rare** Angioedema · gynaecomastia · hearing loss · severe cutaneous adverse reactions (SCARs)
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for atorvastatin tablets (muscle effects).
  Medicines for Children leaflet: Atorvastatin for high cholesterol
  www.medicinesforchildren.org.uk/medicines/atorvastatin-for-high-cholesterol/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

- **Atorvastatin (Non-proprietary)**
  Atorvastatin (as Atorvastatin calcium trihydrate) 4 mg per 1 ml Atorvastatin 20mg/5ml oral suspension sugar free sugar-free | 150 ml PoM £198.76

Tablet

- **Atorvastatin (Non-proprietary)**
  Atorvastatin (as Atorvastatin calcium trihydrate) 10 mg Atorvastatin 10mg tablets | 28 tablet PoM £13.00 DT = £0.71 | 90 tablet PoM £2.76
  Atorvastatin (as Atorvastatin calcium trihydrate) 20 mg Atorvastatin 20mg tablets | 28 tablet PoM £24.64 DT = £0.93 | 90 tablet PoM £3.85
  Atorvastatin (as Atorvastatin calcium trihydrate) 30 mg Atorvastatin 30mg tablets | 28 tablet PoM £24.51 DT = £24.51
  Atorvastatin (as Atorvastatin calcium trihydrate) 40 mg Atorvastatin 40mg tablets | 28 tablet PoM £24.64 DT = £0.99 | 90 tablet PoM £4.10
  Atorvastatin (as Atorvastatin calcium trihydrate) 60 mg Atorvastatin 60mg tablets | 28 tablet PoM £28.01 DT = £28.01
  Atorvastatin (as Atorvastatin calcium trihydrate) 80 mg Atorvastatin 80mg tablets | 28 tablet PoM £28.21 DT = £1.33
- **Lipitor** (Viatris UK Healthcare Ltd)
  Atorvastatin (as Atorvastatin calcium trihydrate) 10 mg Lipitor 10mg tablets | 28 tablet PoM £13.00 DT = £0.71
  Atorvastatin (as Atorvastatin calcium trihydrate) 20 mg Lipitor 20mg tablets | 28 tablet PoM £24.64 DT = £0.93
  Atorvastatin (as Atorvastatin calcium trihydrate) 40 mg Lipitor 40mg tablets | 28 tablet PoM £24.64 DT = £0.99
  Atorvastatin (as Atorvastatin calcium trihydrate) 80 mg Lipitor 80mg tablets | 28 tablet PoM £28.21 DT = £1.33

Chewable tablet

CAUTIONARY AND ADVISORY LABELS 24

- **Lipitor** (Viatris UK Healthcare Ltd)
  Atorvastatin (as Atorvastatin calcium trihydrate) 10 mg Lipitor 10mg chewable tablets sugar-free | 30 tablet PoM £13.80 DT = £13.80
  Atorvastatin (as Atorvastatin calcium trihydrate) 20 mg Lipitor 20mg chewable tablets sugar-free | 30 tablet PoM £26.40 DT = £26.40

F 144

Fluvastatin

20-Jul-2021

INDICATIONS AND DOSE

Heterozygous familial hypercholesterolaemia

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 9–17 years: Initially 20 mg daily, dose to be taken in the evening, then adjusted in steps of 20 mg daily (max. per dose 40 mg twice daily), adjusted at intervals of at least 6 weeks; maximum 80 mg per day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 9–17 years: 80 mg daily, dose form is not appropriate for initial dose titration

INTERACTIONS → Appendix 1: statins

SIDE-EFFECTS

- **Rare or very rare** Angioedema · face oedema · lupus-like syndrome · muscle weakness · sensation abnormal · vasculitis

BREAST FEEDING Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT

Dose adjustments EvGr Doses above 40 mg daily should be initiated with caution if creatinine clearance less than 30 mL/minute (limited information available), M see p. 15.

PATIENT AND CARER ADVICE Patient counselling is advised for fluvastatin tablets/capsules (muscle effects).

NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Fluvastatin (*Lescol*®) for the secondary prevention of coronary events after percutaneous coronary intervention (February 2004)** SMC No. 76/04 Recommended with restrictions

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

- **Dorisin XL** (Aspire Pharma Ltd)
  Fluvastatin (as Fluvastatin sodium) 80 mg Dorisin XL 80mg tablets | 28 tablet PoM £19.20 DT = £19.20
- **Nandovar XL** (Sandoz Ltd)
  Fluvastatin (as Fluvastatin sodium) 80 mg Nandovar XL 80mg tablets | 28 tablet PoM £16.32 DT = £19.20

Capsule

- **Fluvastatin (Non-proprietary)**
  Fluvastatin (as Fluvastatin sodium) 20 mg Fluvastatin 20mg capsules | 28 capsule PoM £6.96 DT = £2.87
  Fluvastatin (as Fluvastatin sodium) 40 mg Fluvastatin 40mg capsules | 28 capsule PoM £7.42 DT = £3.19

F 144

Pravastatin sodium

26-Apr-2021

INDICATIONS AND DOSE

Hyperlipidaemia including familial hypercholesterolaemia

- BY MOUTH
- Child 8–13 years: 10 mg daily, then increased if necessary up to 20 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks
- Child 14–17 years: 10 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce maximum daily dose with concurrent use of glecaprevir with pibrentasvir—consult product literature.

INTERACTIONS → Appendix 1: statins

SIDE-EFFECTS

- **Uncommon** Hair abnormal · scalp abnormal · urinary disorders · vision disorders

BREAST FEEDING Manufacturer advises avoid—small amount of drug present in breast milk.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises initial dose reduction to 10 mg daily; adjust according to response.

RENAL IMPAIRMENT

Dose adjustments Manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment.

PATIENT AND CARER ADVICE Patient counselling is advised for pravastatin tablets (muscle effects).

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Pravastatin sodium (Non-proprietary)**
  Pravastatin sodium 10 mg Pravastatin 10mg tablets | 28 tablet PoM £2.68 DT = £0.95
  Pravastatin sodium 20 mg Pravastatin 20mg tablets | 28 tablet PoM £3.05 DT = £1.09
  Pravastatin sodium 40 mg Pravastatin 40mg tablets | 28 tablet PoM £3.82 DT = £1.29

F 144

Rosuvastatin

01-Nov-2021

INDICATIONS AND DOSE

Heterozygous familial hypercholesterolaemia (specialist use only)

- BY MOUTH
- Child 6–9 years: Initially 5 mg once daily, then increased if necessary up to 10 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

- Child 10–17 years: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks, use lower max. dose in children with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity)

Homozygous familial hypercholesterolaemia (specialist use only)

- BY MOUTH
- Child 6–17 years: Initially 5–10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks, use lower max. dose in children with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity)
- Child 6–17 years (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks, use lower max. dose in children with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity).

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- EvGr Max. dose 5 mg daily with concurrent use of glecaprevir with pibrentasvir.
- Initially 5 mg daily with concurrent use of atazanavir boosted with ritonavir—max. dose 10 mg daily.
- Initially 5 mg daily with concurrent use of lopinavir boosted with ritonavir; for max. daily dose—consult product literature. M

- **INTERACTIONS** → Appendix 1: statins
- **SIDE-EFFECTS**
- **Rare or very rare** Arthralgia · gynaecomastia · haematuria · polyneuropathy
- **Frequency not known** Cough · dyspnoea · oedema · proteinuria · Stevens-Johnson syndrome · tendon disorders
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** EvGr Avoid if creatinine clearance less than 30 mL/minute. M
  Dose adjustments See p. 15.
  EvGr Reduce initial dose if creatinine clearance 30–60 mL/minute. M
- **MONITORING REQUIREMENTS** Manufacturer advises consider routine monitoring of renal function when using 40 mg daily dose.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for rosuvastatin tablets (muscle effects).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

- Rosuvastatin (Non-proprietary)
  Rosuvastatin (as Rosuvastatin calcium) 5 mg Rosuvastatin 5mg tablets | 28 tablet PoM £18.03 DT = £0.92
  Rosuvastatin (as Rosuvastatin calcium) 10 mg Rosuvastatin 10mg tablets | 28 tablet PoM £18.03 DT = £1.04
  Rosuvastatin (as Rosuvastatin calcium) 20 mg Rosuvastatin 20mg tablets | 28 tablet PoM £26.02 DT = £1.27
  Rosuvastatin (as Rosuvastatin calcium) 40 mg Rosuvastatin 40mg tablets | 28 tablet PoM £29.69 DT = £1.70
- Crestor (AstraZeneca UK Ltd)
  Rosuvastatin (as Rosuvastatin calcium) 5 mg Crestor 5mg tablets | 28 tablet PoM £18.03 DT = £0.92
  Rosuvastatin (as Rosuvastatin calcium) 10 mg Crestor 10mg tablets | 28 tablet PoM £18.03 DT = £1.04
  Rosuvastatin (as Rosuvastatin calcium) 20 mg Crestor 20mg tablets | 28 tablet PoM £26.02 DT = £1.27
  Rosuvastatin (as Rosuvastatin calcium) 40 mg Crestor 40mg tablets | 28 tablet PoM £29.69 DT = £1.70

144

Simvastatin

20-Jul-2021

- **INDICATIONS AND DOSE**

Hyperlipidaemia including familial hypercholesterolaemia

- BY MOUTH
- Child 5–9 years: Initially 10 mg once daily, dose to be taken at night, then increased if necessary up to 20 mg once daily, dose to be taken at night, increased at intervals of at least 4 weeks
- Child 10–17 years: Initially 10 mg once daily, dose to be taken at night, then increased if necessary up to 40 mg once daily, dose to be taken at night, increased at intervals of at least 4 weeks

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. dose 10 mg daily with concurrent use of bezafibrate—no specific recommendation made for children.
- Manufacturer advises max. dose 20 mg daily with concurrent use of amiodarone or amlodipine—no specific recommendation made for children.
- Manufacturer advises reduce dose with concurrent use of some moderate inhibitors of CYP3A4 (max. 20 mg daily with verapamil and diltiazem)—no specific recommendation made for children.

- **UNLICENSED USE** Not licensed for use in children under 10 years.
- **INTERACTIONS** → Appendix 1: statins
- **SIDE-EFFECTS**
- **Rare or very rare** Acute kidney injury · anaemia · muscle cramps
- **Frequency not known** Cognitive impairment
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT**
  Dose adjustments EvGr Doses above 10 mg daily should be used with caution if creatinine clearance less than 30 mL/minute, M see p. 15.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

EXCIPIENTS: May contain Propylene glycol

- Simvastatin (Non-proprietary)
  Simvastatin 4 mg per 1 ml Simvastatin 20mg/5ml oral suspension sugar free sugar-free | 150 ml PoM £173.89 DT = £173.89
  Simvastatin 8 mg per 1 ml Simvastatin 40mg/5ml oral suspension sugar free sugar-free | 150 ml PoM £250.63 DT = £250.63

Tablet

- Simvastatin (Non-proprietary)
  Simvastatin 10 mg Simvastatin 10mg tablets | 28 tablet PoM £14.42 DT = £0.80 | 500 tablet PoM £11.61–£14.29
  Simvastatin 20 mg Simvastatin 20mg tablets | 28 tablet PoM £23.75 DT = £0.82 | 500 tablet PoM £11.25–£14.82
  Simvastatin 40 mg Simvastatin 40mg tablets | 28 tablet PoM £23.75 DT = £0.94 | 500 tablet PoM £12.50–£16.79
  Simvastatin 80 mg Simvastatin 80mg tablets | 28 tablet PoM £6.00 DT = £1.31
- Zocor (Organon Pharma (UK) Ltd)
  Simvastatin 10 mg Zocor 10mg tablets | 28 tablet PoM £18.03 DT = £0.80
  Simvastatin 20 mg Zocor 20mg tablets | 28 tablet PoM £29.69 DT = £0.82
  Simvastatin 40 mg Zocor 40mg tablets | 28 tablet PoM £29.69 DT = £0.94

Simvastatin with ezetimibe

10-Dec-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin p. 147, ezetimibe p. 143.

● **INDICATIONS AND DOSE**

Homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients over 10 years stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone

▸ BY MOUTH

▸ Child (initiated by a specialist): (consult product literature)

● **INTERACTIONS** → Appendix 1: ezetimibe · statins

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▸ **Inegy** (Organon Pharma (UK) Ltd)

Ezetimibe 10 mg, Simvastatin 20 mg Inegy 10mg/20mg tablets | 28 tablet PoM £33.42 DT = £33.42

Ezetimibe 10 mg, Simvastatin 40 mg Inegy 10mg/40mg tablets | 28 tablet PoM £38.98 DT = £38.98

Ezetimibe 10 mg, Simvastatin 80 mg Inegy 10mg/80mg tablets | 28 tablet PoM £41.21 DT = £41.21

LIPID MODIFYING DRUGS › OTHER

Evolocumab

14-Oct-2021

● **DRUG ACTION** Evolocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

● **INDICATIONS AND DOSE**

Homozygous familial hypercholesterolaemia (in combination with other lipid-lowering therapies)

▸ BY SUBCUTANEOUS INJECTION

▸ Child 12–17 years: Initially 420 mg every month; increased if necessary to 420 mg every 2 weeks, if inadequate response after 12 weeks of treatment, to be administered into the thigh, abdomen or upper arm

Homozygous familial hypercholesterolaemia in patients on apheresis (in combination with other lipid-lowering therapies)

▸ BY SUBCUTANEOUS INJECTION

▸ Child 12–17 years: 420 mg every 2 weeks, to correspond with apheresis schedule, to be administered into the thigh, abdomen or upper arm

● **SIDE-EFFECTS**

▸ **Common or very common** Arthralgia · back pain · hypersensitivity · increased risk of infection · nausea · skin reactions

▸ **Uncommon** Influenza like illness

▸ **Rare or very rare** Angioedema

● **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of reduced efficacy; no information available in severe impairment).

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.

● **PATIENT AND CARER ADVICE** Patients and their carers should be given training in subcutaneous injection technique.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▸ **Repatha SureClick** (Amgen Ltd)

Evolocumab 140 mg per 1 ml Repatha SureClick 140mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection PoM £340.20 DT = £340.20

7 Myocardial ischaemia

Other drugs used for Myocardial ischaemia Glyceryl trinitrate, p. 149

NITRATES

Nitrates

16-Sep-2021

Overview

Nitrates (such as glyceryl trinitrate p. 149) are potent coronary vasodilators, but their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects (such as flushing, headache, and postural hypotension) may limit therapy, especially if the child is unusually sensitive to the effects of nitrates or is hypovolaemic. Glyceryl trinitrate is also used in extravasation.

Nitrates

● **CONTRA-INDICATIONS** Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema

● **CAUTIONS** Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities

CAUTIONS, FURTHER INFORMATION

▸ Tolerance Children receiving nitrates continuously throughout the day can develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 8 hours each day usually maintains effectiveness in such patients.

● **SIDE-EFFECTS**

▸ **Common or very common** Arrhythmias · asthenia · cerebral ischaemia · dizziness · drowsiness · flushing · headache · hypotension · nausea

▸ **Uncommon** Circulatory collapse · diarrhoea · skin reactions · syncope · vomiting

● **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated in nitrate hypersensitivity. Ⓜ

● **BREAST FEEDING** No information available—manufacturers advise use only if potential benefit outweighs risk.

● **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in severe impairment.

● **RENAL IMPAIRMENT** In general, manufacturers advise caution in severe impairment.

● **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate during intravenous infusion.

● **TREATMENT CESSATION** Avoid abrupt withdrawal.

148

Glyceryl trinitrate

29-Mar-2022

● **INDICATIONS AND DOSE**

Hypertension during and after cardiac surgery | Heart failure after cardiac surgery | Coronary vasoconstriction in myocardial ischaemia | Vasoconstriction in shock

▸ BY CONTINUOUS INTRAVENOUS INFUSION

▸ Neonate: 0.2–0.5 microgram/kg/minute, adjusted according to response, maintenance 1–3 micrograms/kg/minute (max. per dose 10 micrograms/kg/minute).

▸ Child: Initially 0.2–0.5 microgram/kg/minute, adjusted according to response, maintenance 1–3 micrograms/kg/minute (max. per dose 10 micrograms/kg/minute); maximum 200 micrograms/minute

● **UNLICENSED USE** Not licensed for use in children.

● **INTERACTIONS** → Appendix 1: nitrates

● **SIDE-EFFECTS**

▸ **Uncommon** Cardiac disorder · cyanosis

▸ **Rare or very rare** Methaemoglobinaemia · respiratory disorder · restlessness

▸ **Frequency not known** Hyperhidrosis

● **PREGNANCY** Not known to be harmful.

● **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute to max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter) with Glucose 5% or Sodium Chloride 0.9%. *Neonatal intensive care*, dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 1 microgram/kg/minute; max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter).

Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glyceryl trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/ml to be diluted before use.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

EXCIPIENTS: May contain Ethanol, propylene glycol

▸ **Glyceryl trinitrate (Non-proprietary)**

Glyceryl trinitrate 1 mg per 1 ml Glyceryl trinitrate 50mg/50ml solution for infusion vials | 1 vial PoM £17.40 (Hospital only)

Glyceryl trinitrate 5 mg per 1 ml Glyceryl trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule PoM £64.90 (Hospital only)

Glyceryl trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule PoM £32.45 (Hospital only)

▸ **Nitronal** (Beaumont Pharma Ltd)

Glyceryl trinitrate 1 mg per 1 ml Nitronal 5mg/5ml solution for infusion ampoules | 10 ampoule PoM £18.04

Nitronal 50mg/50ml solution for infusion vials | 1 vial PoM £14.76

7.1 Cardiac arrest

Cardiopulmonary resuscitation

05-May-2021

Overview

The algorithms for cardiopulmonary resuscitation (Life support algorithm (image) inside back pages) reflect the recommendations of the Resuscitation Council (UK) and cover paediatric out-of-hospital basic life support, paediatric basic life support, paediatric advanced life support, and newborn life support; these have been reproduced with the kind permission of the Resuscitation Council (UK). The guidelines are available at www.resus.org.uk.

Paediatric advanced life support

Cardiopulmonary (cardiac) arrest in children occurs less frequently than adults and mostly represents the terminal event of circulatory failure or respiratory failure.

During cardiopulmonary arrest in children without intravenous access, the intraosseous route is an alternative.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 186.

Other drugs used for Cardiac arrest Atropine sulfate, p. 921

SYMPATHOMIMETICS › VASOCONSTRICTOR

Adrenaline/epinephrine

20-Jan-2022

● **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta$_1$ effects); it can cause peripheral vasodilation (a beta$_2$ effect) or vasoconstriction (an alpha effect).

● **INDICATIONS AND DOSE**

Cardiopulmonary resuscitation (specialist use only)

▸ BY SLOW INTRAVENOUS INJECTION

▸ Neonate up to 1 days: Consult Resuscitation Council (UK) guidance on newborn resuscitation or local protocols.

▸ Neonate 1 days to 28 days: 10 micrograms/kg every 3–5 minutes as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended, suitable syringe to be used for measuring small volume.

▸ Child: 10 micrograms/kg every 3–5 minutes (max. per dose 1 mg) as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended, suitable syringe to be used for measuring small volume

Acute hypotension

▸ BY CONTINUOUS INTRAVENOUS INFUSION

▸ Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.

▸ Child: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension

Croup (when not effectively controlled with corticosteroid treatment)

▸ BY INHALATION OF NEBULISED SOLUTION

▸ Child 1 month–11 years: 400 micrograms/kg (max. per dose 5 mg), dose to be repeated after 30 minutes if necessary

PHARMACOKINETICS

▸ The effects of nebulised adrenaline for the treatment of croup lasts for 2–3 hours.

Emergency treatment of acute anaphylaxis (under expert supervision)

▸ BY INTRAMUSCULAR INJECTION

▸ Child up to 6 months: 100–150 micrograms, using adrenaline 1 in 1000 (1 mg/mL) injection, repeat dose after 5 minutes if no response; if life-threatening features persist, further doses can be given every 5 minutes until specialist critical care

continued →

available, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
- Child 6 months–5 years: 150 micrograms, using adrenaline 1 in 1000 (1 mg/mL) injection, repeat dose after 5 minutes if no response; if life-threatening features persist, further doses can be given every 5 minutes until specialist critical care available, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
- Child 6–11 years: 300 micrograms, using adrenaline 1 in 1000 (1 mg/mL) injection, repeat dose after 5 minutes if no response; if life-threatening features persist, further doses can be given every 5 minutes until specialist critical care available, to be injected preferably into the anterolateral aspect of the middle third of the thigh
- Child 12–17 years: 500 micrograms, using adrenaline 1 in 1000 (1 mg/mL) injection, repeat dose after 5 minutes if no response; if life-threatening features persist, further doses can be given every 5 minutes until specialist critical care available, to be injected preferably into the anterolateral aspect of the middle third of the thigh, 300 micrograms to be administered if child is small or prepubertal

Refractory anaphylaxis [persistent symptoms despite at least 2 appropriate doses of intramuscular adrenaline/epinephrine] (specialist use only)

- BY INTRAVENOUS INFUSION
- Child: Consult Resuscitation Council (UK) emergency treatment of anaphylaxis guideline or local protocols

EMERADE® 150 MICROGRAMS

Acute anaphylaxis (for self-administration at the first signs of anaphylaxis)—product not available, see Important Safety Information

- BY INTRAMUSCULAR INJECTION
- Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5 minutes as required
- Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

EMERADE® 300 MICROGRAMS

Acute anaphylaxis (for self-administration at the first signs of anaphylaxis)

- BY INTRAMUSCULAR INJECTION
- Child (body-weight 31 kg and above): 300 micrograms, then 300 micrograms after 5 minutes as required, on the basis of a dose of 10 micrograms/kg, 500 micrograms may be more appropriate for some patients, depending on clinical judgement

EMERADE® 500 MICROGRAMS

Acute anaphylaxis (for self-administration at the first signs of anaphylaxis)

- BY INTRAMUSCULAR INJECTION
- Child 12–17 years (body-weight 60 kg and above): 500 micrograms, then 500 micrograms after 5 minutes as required

EPIPEN® AUTO-INJECTOR 0.3MG

Acute anaphylaxis (for self-administration at the first signs of anaphylaxis)

- BY INTRAMUSCULAR INJECTION
- Child (body-weight 26 kg and above): 300 micrograms, then 300 micrograms after 5 minutes as required

EPIPEN® JR AUTO-INJECTOR 0.15MG

Acute anaphylaxis (for self-administration at the first signs of anaphylaxis)

- BY INTRAMUSCULAR INJECTION
- Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5 minutes as required
- Child (body-weight 15–25 kg): 150 micrograms, then 150 micrograms after 5 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

JEXT® 150 MICROGRAMS

Acute anaphylaxis (for self-administration at the first signs of anaphylaxis)

- BY INTRAMUSCULAR INJECTION
- Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5 minutes as required
- Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

JEXT® 300 MICROGRAMS

Acute anaphylaxis (for self-administration at the first signs of anaphylaxis)

- BY INTRAMUSCULAR INJECTION
- Child (body-weight 31 kg and above): 300 micrograms, then 300 micrograms after 5 minutes as required

● UNLICENSED USE

- With intravenous use EvGr Adrenaline is used for cardiopulmonary resuscitation in neonates and infants with body-weight under 5 kg, A but it is not licensed for this age group.
- With intravenous use for acute hypotension Adrenaline 1 in 1000 (1 mg/mL) solution is not licensed for intravenous administration.
- With intramuscular use EvGr Adrenaline is used in the doses provided in the BNF for the emergency treatment of acute anaphylaxis in children up to 6 months, A but these may differ from those licensed.
- With intramuscular use for acute anaphylaxis Auto-injectors delivering 150-microgram dose of adrenaline may not be licensed for use in children with body-weight under 15 kg.
- When used for croup Expert sources advise adrenaline 1 in 1000 (1 mg/mL) solution may be used, but it is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

- With intravenous use

Intravenous route should be used with **extreme care** by specialists only.

MHRA/CHM ADVICE: ADRENALINE AUTO-INJECTORS: UPDATED ADVICE AFTER EUROPEAN REVIEW (AUGUST 2017)

- With intramuscular use

Following a European review of all adrenaline auto-injectors approved in the EU, the MHRA recommend that 2 adrenaline auto-injectors are prescribed, which patients should carry at all times. This is particularly important for patients with allergic asthma, who are at increased risk of a severe anaphylactic reaction. Patients with allergies and their carers should be trained to use the particular auto-injector they have been prescribed and encouraged to practise using a trainer device. Patients are advised to check the expiry date of the adrenaline auto-injectors and obtain replacements before they expire.

MHRA/CHM ADVICE: ADRENALINE AUTO-INJECTORS: REMINDER FOR PRESCRIBERS TO SUPPORT SAFE AND EFFECTIVE USE (NOVEMBER 2021)

▸ With intramuscular use

Following the implementation of corrective actions to resolve the issue that caused some devices to fail to activate and deliver adrenaline, *Emerade*® 300 microgram and 500 microgram adrenaline auto-injectors have been resupplied to the market. The *Emerade*® 150 microgram auto-injector will not be returning to market at this time. The *Epipen*® and *Jext*® brands of adrenaline auto-injector in a strength of **300 microgram** continue to be suitable alternatives to the *Emerade*®**500 microgram** adrenaline auto-injector. Healthcare professionals are advised that for each adrenaline auto-injector, the advice in the Summary of Product Characteristics should be followed when prescribing appropriate doses for individual patients. Patients should be reminded to:

- carry 2 in-date adrenaline auto-injectors with them at all times and to replace them before they expire
- use the adrenaline auto-injector as soon as a suspected severe allergic reaction (anaphylaxis) occurs, especially any signs affecting the **Airway** (swelling of the tongue or a feeling of constriction in the throat), **Breathing** (wheezing, difficulty in breathing), or **Circulation** (feeling faint, dizzy, cold clammy skin)

Training for patients and their carers specific to their prescribed adrenaline auto-injector should be provided and they should be encouraged to order a trainer device from the manufacturer to ensure they are familiar with using their auto-injector, and to sign up for expiry alert services.

- **CAUTIONS** Arrhythmias · cerebrovascular disease · cor pulmonale · diabetes mellitus · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · ischaemic heart disease · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma

  CAUTIONS, FURTHER INFORMATION Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**

  GENERAL SIDE-EFFECTS

  ▸ **Rare or very rare** Cardiomyopathy

  ▸ **Frequency not known** Angina pectoris · angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · CNS haemorrhage · confusion · dizziness · dry mouth · dyspnoea · headache · hepatic necrosis · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension (increased risk of cerebral haemorrhage) · hypokalaemia · injection site necrosis · insomnia · intestinal necrosis · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitations · peripheral coldness · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · renal necrosis · soft tissue necrosis · tremor · urinary disorders · vomiting

  SPECIFIC SIDE-EFFECTS

  ▸ With intramuscular use Muscle necrosis · necrotising fasciitis · peripheral ischaemia

  ▸ With intravenous use Hemiplegia · muscle rigidity

- **PREGNANCY**

  ▸ With intramuscular use or intravenous use May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.

- **BREAST FEEDING**

  ▸ With intramuscular use or intravenous use Present in milk but unlikely to be harmful as poor oral bioavailability.

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Monitor blood pressure and ECG.

- **DIRECTIONS FOR ADMINISTRATION**

  ▸ With intravenous use for acute hypotension For *continuous intravenous infusion*, expert sources advise dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. *Neonatal intensive care*, expert sources advise dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. Expert sources advise these infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution.

  ▸ When used for croup For nebulisation, expert sources advise adrenaline 1 in 1000 solution may be diluted with sterile sodium chloride 0.9% solution.

- **PRESCRIBING AND DISPENSING INFORMATION**

  ▸ With intramuscular use It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access. Great vigilance is needed to ensure that the *correct strength* of adrenaline injection is used; anaphylactic shock kits need to make a *very clear distinction* between the 1 in 10 000 strength and the 1 in 1000 strength. Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection. Packs for self-administration need to be **clearly labelled with instructions** on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. Adrenaline for administration by intramuscular injection is available in 'auto-injectors' (e.g. *Emerade*®, *EpiPen*®, or *Jext*®), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific. To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed. If switching between brands, patients should receive full training in use of the new auto-injector device. Licensed doses differ between brands of adrenaline auto-injectors. Adrenaline bioavailability has the potential to be influenced by a number of factors including formulation, propulsive force of the device, needle length and patient specific factors—consult product literature for further information.

- **PATIENT AND CARER ADVICE**

  ▸ With intramuscular use Patients and carers should be advised on the safe and effective use of adrenaline auto-injector devices in advance—see also *Important safety information*.

  At the first signs of anaphylaxis Patients and carers should be advised the following:

  - Use your adrenaline auto-injector immediately if you have any signs of anaphylaxis. Use even if in doubt of severity, don't delay;
  - Call 999 and say anaphylaxis ("ana-fill-axis")—straight after using your adrenaline auto-injector;
  - Lie down and raise your legs;
  - Use a second adrenaline auto-injector if your symptoms haven't improved after 5 minutes;

- Lying down is important to keep blood flowing to your organs; you can sit up if you are struggling to breathe, but keep your legs elevated as far as possible and lie back down again as soon as you can. Young children may need to lie down first to help assist injection administration by carer;
- An ambulance should be called even if symptoms appear to be improving after using an adrenaline auto-injector and the individual should not be left alone.

Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/medicines/adrenaline-auto-injector-for-anaphylaxis/

JEXT® 300 MICROGRAMS 1.1 mL of the solution remains in the auto-injector device after use.

JEXT® 150 MICROGRAMS 1.25 mL of the solution remains in the auto-injector device after use.

EPIPEN® JR AUTO-INJECTOR 0.15MG 1.7 mL of the solution remains in the auto-injector device after use.

EMERADE® 150 MICROGRAMS 0.35 mL of the solution remains in the auto-injector device after use.

EPIPEN® AUTO-INJECTOR 0.3MG 1.7 mL of the solution remains in the auto-injector device after use.

EMERADE® 500 MICROGRAMS No solution remains in the auto-injector device after use.

EMERADE® 300 MICROGRAMS 0.2 mL of the solution remains in the auto-injector device after use.

- **EXCEPTIONS TO LEGAL CATEGORY**

▸ With intramuscular use POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

EXCIPIENTS: May contain Sulfites

▸ **Adrenaline/epinephrine (Non-proprietary)**

Adrenaline 100 microgram per 1 ml Adrenaline (base) 100micrograms/1ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule PoM £101.85–£139.02 DT = £101.85

8 Oedema

Diuretics

14-Sep-2020

Overview

Diuretics are used for a variety of conditions in children including pulmonary oedema (caused by conditions such as respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and hypertension. Hypertension in children is often resistant to therapy and may require the use of several drugs in combination. Maintenance of fluid and electrolyte balance can be difficult in children on diuretics, particularly neonates whose renal function may be immature.

Loop diuretics are used for pulmonary oedema, congestive heart failure, and in renal disease.

Thiazides are used less commonly than loop diuretics but are often used in combination with loop diuretics or spironolactone p. 140 in the management of pulmonary oedema and, in lower doses, for hypertension associated with cardiac disease.

Aminophylline **infusion** p. 182 has been used with intravenous furosemide p. 154 to relieve fluid overload in critically ill children.

Heart failure

Heart failure is less common in children than in adults; it can occur as a result of congenital heart disease (e.g. septal defects), dilated cardiomyopathy, myocarditis, or cardiac surgery. Drug treatment of heart failure due to left ventricular systolic dysfunction is covered below; optimal management of heart failure with preserved left ventricular function has not been established.

Acute heart failure can occur after cardiac surgery or as a complication in severe acute infections with or without myocarditis. Therapy consists of volume loading, vasodilator or inotropic drugs.

Chronic heart failure is initially treated with a **loop diuretic**, usually furosemide supplemented with spironolactone, amiloride hydrochloride p. 156, or potassium chloride p. 686.

If diuresis with furosemide is insufficient, the addition of metolazone p. 156 or a **thiazide diuretic** can be considered. With metolazone the resulting diuresis can be profound and care is needed to avoid potentially dangerous electrolyte disturbance.

If diuretics are insufficient an ACE inhibitor, titrated to the maximum tolerated dose, can be used. **ACE inhibitors** are used for the treatment of all grades of heart failure in adults and can also be useful for children with heart failure. Addition of digoxin p. 86 can be considered in children who remain symptomatic despite treatment with a diuretic and an ACE inhibitor.

Some beta-blockers improve outcome in adults with heart failure, but data on beta-blockers in children are limited. Carvedilol p. 139 has vasodilatory properties and therefore (like ACE inhibitors) also lowers afterload.

In children receiving specialist cardiology care, the phosphodiesterase type-3 inhibitor enoximone p. 140 is sometimes used by mouth for its inotropic and vasodilator effects. Spironolactone is usually used as a potassium-sparing drug with a loop diuretic; in adults low doses of spironolactone are effective in the treatment of heart failure. Careful monitoring of serum potassium is necessary if spironolactone is used in combination with an ACE inhibitor.

Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of *hypertension* a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 123 is licensed for use in children; chlorothiazide p. 124 is also used.

Chlortalidone p. 156, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days in younger children.

Metolazone is particularly effective when combined with a loop diuretic (even in renal failure) and is most effective when given 30–60 minutes before furosemide profound diuresis can occur and the child should therefore be monitored carefully.

Loop diuretics

Loop diuretics inhibit reabsorption of sodium, potassium, and chloride from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

Furosemide and bumetanide p. 154 are similar in activity; they produce dose-related diuresis. Furosemide is used extensively in children. It can be used for pulmonary oedema (e.g. in respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and in renal disease.

Potassium-sparing diuretics and aldosterone antagonists

Spironolactone is the most commonly used potassium sparing diuretic in children; it is an aldosterone antagonist and enhances potassium retention and sodium excretion in the distal tubule. Spironolactone is combined with other diuretics to reduce urinary potassium loss. It is also used in nephrotic syndrome, the long-term management of Bartter's syndrome, and high doses can help to control ascites in babies with chronic neonatal hepatitis. The clinical value of spironolactone in the management of pulmonary oedema in preterm neonates with chronic lung disease is uncertain.

Potassium canrenoate p. 139 given intravenously, is an alternative aldosterone antagonist that may be useful if a potassium-sparing diuretic is required and the child is unable to take oral medication. It is metabolised to canrenone, which is also a metabolite of spironolactone.

Amiloride hydrochloride on its own is a weak diuretic. It causes retention of potassium and is therefore given with thiazide or loop diuretics as an alternative to giving potassium supplements.

A potassium-sparing diuretic such as spironolactone or amiloride hydrochloride may also be used in the management of amphotericin B-induced hypokalaemia.

Potassium supplements must **not** be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a child receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe diuretics separately in children, the use of fixed combinations may be justified in older children if compliance is a problem. (Some preparations may not be licensed for use in children—consult product literature).

Other diuretics

Mannitol p. 155 is used to treat cerebral oedema, raised intraocular pressure, peripheral oedema, and acites.

The carbonic anhydrase inhibitor acetazolamide p. 775 is a weak diuretic although it is little used for its diuretic effect.

Eye drops of dorzolamide p. 776 and brinzolamide p. 776 inhibit the formation of aqueous humour and are used in glaucoma.

Diuretics with potassium

Diuretics and potassium supplements should be prescribed separately.

Advanced Pharmacy Services

Children taking diuretics may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

DIURETICS › LOOP DIURETICS

Loop diuretics

- **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.
- **CONTRA-INDICATIONS** Anuria · renal failure due to nephrotoxic or hepatotoxic drugs · severe hypokalaemia · severe hyponatraemia
- **CAUTIONS** Can cause acute urinary retention in children with obstruction of urinary outflow · can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) · can excacerbate gout · comatose and precomatose states associated with liver cirrhosis · hypotension should be corrected before initiation of treatment · hypovolaemia should be corrected before initiation of treatment

  CAUTIONS, FURTHER INFORMATION

  - Potassium loss Hypokalaemia can occur with loop diuretics.

    Hypokalaemia is particularly dangerous in children being treated with cardiac glycosides. In hepatic impairment, hypokalaemia caused by diuretics can precipitate encephalopathy.

    The use of potassium-sparing diuretics avoids the need to take potassium supplements.
  - Urinary retention Loop diuretics can cause acute urinary retention in children with obstruction of urinary outflow, therefore manufacturer advises adequate urinary output should be established before initiating treatment.
- **SIDE-EFFECTS**
  - **Common or very common** Dizziness · electrolyte imbalance · fatigue · headache · metabolic alkalosis · muscle spasms · nausea
  - **Uncommon** Diarrhoea
  - **Rare or very rare** Bone marrow depression · photosensitivity reaction
  - **Frequency not known** Deafness (more common in renal impairment) · leucopenia · paraesthesia · rash · severe

cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus (more common with rapid intravenous administration, and in renal impairment) · vomiting

- **HEPATIC IMPAIRMENT** Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this.
- **RENAL IMPAIRMENT** High doses or rapid intravenous administration can cause tinnitus and deafness.
  Dose adjustments High doses of loop diuretics may occasionally be needed in renal impairment.
- **MONITORING REQUIREMENTS** Monitor electrolytes during treatment.

F 153

Bumetanide

- **INDICATIONS AND DOSE**

Oedema in heart failure, renal disease, and hepatic disease | Pulmonary oedema

- BY MOUTH
- Child 1 month-11 years: 15–50 micrograms/kg 1–4 times a day (max. per dose 2 mg); maximum 5 mg per day
- Child 12-17 years: Initially 1 mg, dose to be taken in the morning, then 1 mg after 6–8 hours if required

Oedema in heart failure, renal disease, and hepatic disease (severe cases) | Pulmonary oedema (severe cases)

- BY MOUTH
- Child 12-17 years: Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **INTERACTIONS** → Appendix 1: loop diuretics
- **SIDE-EFFECTS**

- **Common or very common** Dehydration · hypotension · skin reactions
- **Uncommon** Breast pain · chest discomfort · ear pain · vertigo
- **Rare or very rare** Hearing impairment
- **Frequency not known** Arthralgia · encephalopathy · gastrointestinal discomfort · gynaecomastia · hyperglycaemia · hyperuricaemia · muscle cramps · musculoskeletal pain (with high doses in renal failure)

- **PREGNANCY** Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
- **BREAST FEEDING** No information available. May inhibit lactation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral solution

- Bumetanide (Non-proprietary)

Bumetanide 200 microgram per 1 ml Bumetanide 1mg/5ml oral solution sugar free sugar-free | 150 ml PoM £198.00 DT = £198.00

Tablet

- Bumetanide (Non-proprietary)

Bumetanide 1 mg Bumetanide 1mg tablets | 28 tablet PoM £7.35 DT = £1.01

Bumetanide 5 mg Bumetanide 5mg tablets | 28 tablet PoM £12.95 DT = £12.95

F 153

Furosemide

(Frusemide)

24-Sep-2020

- **INDICATIONS AND DOSE**

Oedema in heart failure, renal disease, and hepatic disease | Pulmonary oedema

- BY MOUTH
- Neonate: 0.5–2 mg/kg every 12–24 hours, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age under 31 weeks.
- Child 1 month-11 years: 0.5–2 mg/kg 2–3 times a day, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age of under 31 weeks, higher doses may be required in resistant oedema; maximum 80 mg per day; maximum 12 mg/kg per day
- Child 12-17 years: 20–40 mg daily; increased to 80–120 mg daily, in resistant oedema
- BY SLOW INTRAVENOUS INJECTION
- Neonate: 0.5–1 mg/kg every 12–24 hours, alternatively 0.5–1 mg/kg every 24 hours, if corrected gestational age under 31 weeks.
- Child 1 month-11 years: 0.5–1 mg/kg every 8 hours (max. per dose 40 mg) as required, increased if necessary up to 2 mg/kg every 8 hours (max. per dose 40 mg)
- Child 12-17 years: 20–40 mg every 8 hours as required, higher doses may be required in resistant cases
- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: 0.1–2 mg/kg/hour

Oedema in heart failure, renal disease, and hepatic disease following cardiac surgery | Pulmonary oedema following cardiac surgery

- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: Initially 100 micrograms/kg/hour, dose to be doubled every 2 hours until urine output exceeds 1 mL/kg/hour

Oliguria due to acute or chronic renal insufficiency [GFR below 20 mL/minute]

- BY MOUTH
- Child 12-17 years: Initially 250 mg daily, then increased in steps of 250 mg every 4–6 hours (max. per dose 2 g) if required
- BY INTRAVENOUS INFUSION
- Child 1 month-11 years: 2–5 mg/kg up to 4 times a day; maximum 1 g per day
- Child 12-17 years: Initially 250 mg, dose to be administered over 1 hour, increased to 500 mg, increased dose is given if satisfactory urine output not obtained; dose administered over 2 hours, then increased to 1 g, increased dose given if satisfactory response not obtained within subsequent hour; dose to be administered over 4 hours. If no response obtained dialysis probably required;, effective dose of up to 1 g given at a maximum rate of 4 mg/minute can be repeated every 24 hours

- **CAUTIONS** Effect may be prolonged in neonates · hepatorenal syndrome · hypoproteinaemia may reduce diuretic effect and increase risk of side-effects
- **INTERACTIONS** → Appendix 1: loop diuretics
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Agranulocytosis · aplastic anaemia · auditory disorder (more common with rapid intravenous administration, and in renal impairment) · diabetes mellitus · eosinophilia · fever · gout · haemolytic anaemia · malaise · mucosal reaction · nephritis tubulointerstitial · nephrocalcinosis (with long-term use in preterm infants) · nephrolithiasis (with long-term use in preterm infants) ·

pancreatitis acute · shock · skin eruption · tetany · vasculitis

SPECIFIC SIDE-EFFECTS

- With oral use Acute kidney injury · hepatic disorders · metabolic acidosis · psychiatric disorder · urinary disorders
- With parenteral use Acute urinary retention · cholestasis

- **PREGNANCY** Furosemide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
- **BREAST FEEDING** Amount too small to be harmful. May inhibit lactation.
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For *intravenous injection*, give over 5–10 minutes at a usual rate of 100 micrograms/kg/minute (not exceeding 500 micrograms/kg/minute), max. 4 mg/minute; lower rate of infusion may be necessary in renal impairment. For *intravenous infusion*, dilute with Sodium Chloride 0.9% to a concentration of 1–2 mg/mL. Glucose solutions unsuitable (infusion pH must be above 5.5).
- With oral use For administration by *mouth*, tablets can be crushed and mixed with water or injection solution diluted and given by mouth. Risk of ototoxicity may be reduced by giving high oral doses in 2 or more divided doses.
- **PRESCRIBING AND DISPENSING INFORMATION**
- With oral use Some liquid preparations contain alcohol, caution especially in neonates.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Furosemide (Non-proprietary)**

DIURETICS › OSMOTIC DIURETICS

Mannitol

15-Oct-2021

- **INDICATIONS AND DOSE**

Cerebral oedema

- BY INTRAVENOUS INFUSION
- Child 1 month-11 years: 0.25–1.5 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours
- Child 12-17 years: 0.25–2 g/kg, repeated if necessary, to be administered over 30-60 minutes, dose may be repeated 1–2 times after 4–8 hours

Peripheral oedema and ascites

- BY INTRAVENOUS INFUSION
- Child: 1–2 g/kg, to be given over 2–6 hours

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS** Anuria · intracranial bleeding (except during craniotomy) · severe cardiac failure · severe dehydration · severe pulmonary oedema
- **CAUTIONS** Extravasation causes inflammation and thrombophlebitis
- **SIDE-EFFECTS**
- **Common or very common** Cough · headache · vomiting
- **Uncommon** Dizziness · fever · malaise · nausea · pain · skin reactions
- **Frequency not known** Arrhythmia · asthenia · azotaemia · chest pain · chills · coma · compartment syndrome · confusion · congestive heart failure · dry mouth · electrolyte imbalance · fluid imbalance · hyperhidrosis · hypersensitivity · hypertension · lethargy · metabolic acidosis · muscle complaints · musculoskeletal stiffness · nephrotic syndrome · neurotoxicity · peripheral oedema · pulmonary oedema · rebound intracranial pressure increase · renal impairment · rhinitis · seizure · thirst · urinary disorders · vision blurred
- **PREGNANCY** Manufacturer advises avoid unless essential— no information available.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **RENAL IMPAIRMENT** EvGr Caution in severe impairment (consult product literature). ◈
- **PRE-TREATMENT SCREENING** Assess cardiac function before treatment.
- **MONITORING REQUIREMENTS** Monitor fluid and electrolyte balance, serum osmolality, and cardiac, pulmonary and renal function.
- **DIRECTIONS FOR ADMINISTRATION** Examine infusion for crystals. If crystals present, dissolve by warming infusion fluid (allow to cool to body temperature before administration). An in-line filter is recommended.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

- **Mannitol (Non-proprietary)**
  Mannitol 100 mg per 1 ml Polyfusor mannitol 10% infusion 500ml bottles | 1 bottle PoM £5.93 | 12 bottle PoM £71.16
  Mannitol 50g/500ml (10%) infusion Viaflo bags | 1 bag PoM
  Mannitol 150 mg per 1 ml Mannitol 75g/500ml (15%) infusion Viaflo bags | 20 bag PoM (Hospital only)
  Mannitol 200 mg per 1 ml Polyfusor mannitol 20% infusion 500ml bottles | 1 bottle PoM £7.78 | 12 bottle PoM £93.36
  Mannitol 50g/250ml (20%) infusion Viaflex bags | 1 bag PoM
  Mannitol 100g/500ml (20%) infusion Viaflex bags | 1 bag PoM

DIURETICS › POTASSIUM-SPARING DIURETICS

Amiloride hydrochloride

11-Dec-2020

INDICATIONS AND DOSE

Adjunct to thiazide or loop diuretics for oedema in heart failure, and hepatic disease (where potassium conservation desirable)

- BY MOUTH
- Neonate: 100–200 micrograms/kg twice daily.
- Child 1 month-11 years: 100–200 micrograms/kg twice daily; maximum 20 mg per day
- Child 12-17 years: 5–10 mg twice daily

UNLICENSED USE Not licensed for use in children.

CONTRA-INDICATIONS Addison's disease · anuria · hyperkalaemia

CAUTIONS Diabetes mellitus

INTERACTIONS → Appendix 1: potassium-sparing diuretics

SIDE-EFFECTS Alopecia · angina pectoris · aplastic anaemia · appetite decreased · arrhythmia · arthralgia · asthenia · atrioventricular block exacerbated · bladder spasm · chest pain · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · dysuria · electrolyte imbalance · encephalopathy · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · gout · headache · insomnia · jaundice · muscle cramps · nasal congestion · nausea · nervousness · neutropenia · pain · palpitations · paraesthesia · postural hypotension · sexual dysfunction · skin reactions · tinnitus · tremor · vertigo · visual impairment · vomiting

PREGNANCY Not to be used to treat gestational hypertension.

BREAST FEEDING Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT Manufacturers advise avoid in severe impairment.
Monitoring Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

MONITORING REQUIREMENTS Monitor electrolytes.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

EXCIPIENTS: May contain Propylene glycol

- **Amiloride hydrochloride (Non-proprietary)**
  Amiloride hydrochloride 1 mg per 1 ml Amiloride 5mg/5ml oral solution sugar free sugar-free | 150 ml PoM £158.85 DT = £158.85

Tablet

- **Amiloride hydrochloride (Non-proprietary)**
  Amiloride hydrochloride 5 mg Amiloride 5mg tablets | 28 tablet PoM £39.82 DT = £15.66

DIURETICS › THIAZIDES AND RELATED DIURETICS

F 123

Chlortalidone

(Chlorthalidone)

INDICATIONS AND DOSE

Ascites | Oedema in nephrotic syndrome

- BY MOUTH
- Child 5-11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning
- Child 12-17 years: Up to 50 mg daily

Hypertension

- BY MOUTH
- Child 5-11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning
- Child 12-17 years: 25 mg daily, dose to be taken in the morning, then increased if necessary to 50 mg daily

Stable heart failure

- BY MOUTH
- Child 5-11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning
- Child 12-17 years: 25–50 mg daily, dose to be taken in the morning, then increased if necessary to 100–200 mg daily, reduce to lowest effective dose for maintenance

INTERACTIONS → Appendix 1: thiazide diuretics

SIDE-EFFECTS

- **Common or very common** Appetite decreased · gastrointestinal discomfort
- **Uncommon** Gout
- **Rare or very rare** Arrhythmia · diabetes mellitus exacerbated · eosinophilia · glycosuria · hepatic disorders · nephritis tubulointerstitial · pulmonary oedema · respiratory disorder

BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

- **Chlortalidone (Non-proprietary)**
  Chlortalidone 25 mg Chlortalidone 25mg tablets | 100 tablet PoM ₹ (Hospital only)
  Chlortalidone 50 mg Chlortalidone 50mg tablets | 30 tablet PoM £90.55 DT = £88.04
- **Hylaton** (Morningside Healthcare Ltd)
  Chlortalidone 12.5 mg Hylaton 12.5mg tablets | 30 tablet PoM £42.00 DT = £42.00
  Chlortalidone 50 mg Hylaton 50mg tablets | 30 tablet PoM £59.00 DT = £88.04

F 123

Metolazone

20-May-2022

INDICATIONS AND DOSE

Oedema resistant to loop diuretics in heart failure, renal disease and hepatic disease (under expert supervision) | Pulmonary oedema (under expert supervision) | Adjunct to loop diuretics to induce diuresis (under expert supervision)

- BY MOUTH
- Child 1 month-11 years: 100–200 micrograms/kg 1–2 times a day
- Child 12-17 years: 5–10 mg once daily, dose to be taken in the morning; increased if necessary to 5–10 mg twice daily, dose increased in resistant oedema

DOSE EQUIVALENCE AND CONVERSION

- Dosing recommendations for children are based on metolazone tablet preparations with standard bioavailability. Available metolazone preparations may vary in bioavailability. *Xaqua*® (licensed for use in adults) has up to approximately two-fold higher bioavailability than other preparations, therefore the recommended doses can differ from other preparations. Dose adjustment may be necessary and individualised titration based on patient's response and tolerability is advised if switching between preparations.

UNLICENSED USE Not licensed for use in children.

- **CAUTIONS** Acute porphyrias p. 688
- **INTERACTIONS** → Appendix 1: thiazide diuretics
- **SIDE-EFFECTS**
  - **Common or very common** Azotaemia · glycosuria · hypotension · muscle complaints
  - **Uncommon** Arthralgia · gout · vasculitis
  - **Rare or very rare** Apathy · appetite decreased · asthenia · chest pain · chills · confusion · dehydration · drowsiness · gastrointestinal discomfort · haemoconcentration · hepatic disorders · hepatic encephalopathy · hypoplastic anaemia · palpitations · peripheral neuropathy · psychotic depression · renal impairment · restlessness · seizure · severe cutaneous adverse reactions (SCARs) · syncope · tachycardia · venous thrombosis · vertigo · vision blurred
- **BREAST FEEDING** Specialist sources indicate that levels in milk have not been determined, but are likely to be too low to affect the infant. Large doses may suppress lactation.
- **HEPATIC IMPAIRMENT**

  XAQUA ® EvGr Caution in severe impairment. M
- **RENAL IMPAIRMENT** See p. 15. Manufacturer advises metolazone remains effective if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m^2 but is associated with a risk of excessive diuresis.
- **PATIENT AND CARER ADVICE**

  XAQUA ® **Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and fatigue.
- **MEDICINAL FORMS** Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

9 Patent ductus arteriosus

Drugs affecting the ductus arteriosus

Closure of the ductus arteriosus

Patent ductus arteriosus is a frequent problem in premature neonates with respiratory distress syndrome. Substantial left-to-right shunting through the ductus arteriosus may increase the risk of intraventricular haemorrhage, necrotising enterocolitis, bronchopulmonary dysplasia, and possibly death.

Indometacin p. 749 or ibuprofen p. 747 can be used to close the ductus arteriosus. Indometacin has been used for many years and is effective but it reduces cerebral blood flow, and causes a transient fall in renal and gastro-intestinal blood flow. Ibuprofen may also be used; it has little effect on renal function (there may be a small reduction in sodium excretion) when used in doses for closure of the ductus arteriosus; gastro-intestinal problems are uncommon.

If drug treatment fails to close the ductus arteriosus, surgery may be indicated.

Maintenance of patency

In the newborn with duct-dependent congenital heart disease it is often necessary to maintain the patency of the ductus arteriosus whilst awaiting surgery. Alprostadil below (prostaglandin E1) and dinoprostone (prostaglandin E2) below are potent vasodilators that are effective for maintaining the patency of the ductus arteriosus. They are usually given by continuous intravenous infusion, but oral dosing of dinoprostone is still used in some centres. During the infusion of a prostaglandin, the newborn requires careful monitoring of heart rate, blood pressure, respiratory rate, and core body temperature. In the event of complications such as apnoea, profound bradycardia, or severe hypotension, the infusion should be temporarily stopped and the complication dealt with; the infusion should be restarted at a lower dose. Recurrent or prolonged apnoea may require ventilatory support in order for the prostaglandin infusion to continue.

PROSTAGLANDINS AND ANALOGUES

Alprostadil

20-Jul-2020

- **INDICATIONS AND DOSE**

  Maintaining patency of the ductus arteriosus
  - BY CONTINUOUS INTRAVENOUS INFUSION
    - Neonate: Initially 5 nanograms/kg/minute, adjusted according to response, adjusted in steps of 5 nanograms/kg/minute (max. per dose 100 nanograms/kg/minute), maximum dose associated with increased side-effects.
- **UNLICENSED USE** Alprostadil doses in BNF for Children may differ from those in product literature.
- **CONTRA-INDICATIONS** Avoid in hyaline membrane disease
- **CAUTIONS** History of haemorrhage
- **INTERACTIONS** → Appendix 1: alprostadil
- **SIDE-EFFECTS**
  - **Common or very common** Apnoea (more common in neonates under 2 kg) · arrhythmias · diarrhoea · fever · hypotension · seizure · vasodilation
  - **Uncommon** Exostosis · gastrointestinal disorders · vascular fragility
  - **Frequency not known** Cardiac arrest · disseminated intravascular coagulation · hypokalaemia · oedema · sepsis
- **MONITORING REQUIREMENTS** During the infusion of a prostaglandin, the newborn requires careful monitoring of heart rate, blood pressure, respiratory rate, and core body temperature.
  - Monitor arterial pressure, respiratory rate, heart rate, temperature, and venous blood pressure in arm and leg; facilities for intubation and ventilation must be immediately available
- **DIRECTIONS FOR ADMINISTRATION** Expert sources advise dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute. Manufacturer advises undiluted solution must not come into contact with the barrel of the plastic syringe; add the required volume of alprostadil to a volume of infusion fluid in the syringe and then make up to final volume.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  Solution for infusion
  - **Prostin VR** (Pfizer Ltd)

    Alprostadil 500 microgram per 1 ml Prostin VR 500micrograms/1ml concentrate for solution for infusion ampoules | 5 ampoule PoM £375.96 (Hospital only)

Dinoprostone

24-Jun-2021

- **INDICATIONS AND DOSE**

  Maintaining patency of the ductus arteriosus
  - BY CONTINUOUS INTRAVENOUS INFUSION
    - Neonate: Initially 5 nanograms/kg/minute, then increased in steps of 5 nanograms/kg/minute as required; increased to 20 nanograms/kg/minute, doses up to 100 nanogram/kg/minute have been used but are associated with increased side-effects.

continued →

▸ BY MOUTH

▸ Neonate: 20–25 micrograms/kg every 1–2 hours, then increased if necessary to 40–50 micrograms/kg every 1–2 hours, if treatment continues for more than 1 week gradually reduce the dose.

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid in hyaline membrane disease
- **CAUTIONS** History of haemorrhage
- **SIDE-EFFECTS**
- ▸ **Rare or very rare** Disseminated intravascular coagulation
- ▸ **Frequency not known** Asthma · back pain · bronchospasm · cardiac arrest · chills · diarrhoea · dizziness · fever · flushing · headache · hypertension · infection · nausea · uterine rupture · vomiting
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** EvGr Avoid. M
- **MONITORING REQUIREMENTS** Monitor arterial oxygenation, heart rate, temperature, and blood pressure in arm and leg; facilities for intubation and ventilation must be immediately available. During infusion of dinoprostone, the newborn requires careful monitoring of heart rate, blood pressure, respiratory rate and core body temperature.
- **DIRECTIONS FOR ADMINISTRATION**
- ▸ With intravenous use For *continuous intravenous infusion*, dilute to a concentration of 1 microgram/mL with Glucose 5% or Sodium Chloride 0.9%.
- ▸ With oral use For administration by *mouth*, injection solution can be given orally; dilute with water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▸ **Prostin E2** (Pfizer Ltd)

Dinoprostone 1 mg per 1 ml Prostin E2 750micrograms/0.75ml solution for infusion ampoules | 1 ampoule PoM £8.52 (Hospital only)

Dinoprostone 10 mg per 1 ml Prostin E2 5mg/0.5ml solution for infusion ampoules | 1 ampoule PoM £18.40 (Hospital only)

10 Vascular disease

Peripheral vascular disease

22-Mar-2021

Classification and management

Raynaud's phenomenon, a vasospastic peripheral vascular disease, consists of episodic vasospasm of the fingers and toes often associated with exposure to cold. EvGr Referral to a rheumatologist is recommended for children aged 12 years and under with Raynaud's phenomenon.

Management of Raynaud's phenomenon includes avoidance of exposure to cold and Smoking cessation p. 330 (if appropriate). If lifestyle modifications fail and symptoms are having a significant negative impact, a trial of nifedipine p. 121 as prophylaxis can be considered. A Expert sources advise diltiazem hydrochloride below [unlicensed use] may be used in the treatment of Raynaud's phenomenon. In very severe cases, where digital infarction is likely, expert sources advise intravenous infusion of the prostacyclin analogue iloprost p. 133 [unlicensed use] may be considered.

The evidence for drug treatment in *chilblains* is limited and does not support its routine use.

Advanced Pharmacy Services

Children with peripheral vascular disease may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

CALCIUM-CHANNEL BLOCKERS

120

Diltiazem hydrochloride

26-Nov-2021

- **INDICATIONS AND DOSE**

Raynaud's syndrome

- ▸ BY MOUTH
- ▸ Child 12–17 years: 30–60 mg 2–3 times a day

- **UNLICENSED USE** Not licensed for use in Raynaud's syndrome.
- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · cardiogenic shock · heart failure (with reduced ejection fraction) · left ventricular failure with pulmonary congestion · second- or third-degree AV block (unless pacemaker fitted) · severe bradycardia · sick sinus syndrome · significant aortic stenosis
- **CAUTIONS** Bradycardia (avoid if severe) · first degree AV block · prolonged PR interval · significantly impaired left ventricular function
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
- ▸ **Common or very common** Cardiac conduction disorders · constipation · gastrointestinal discomfort · malaise
- ▸ **Uncommon** Arrhythmias · diarrhoea · insomnia · nervousness · postural hypotension
- ▸ **Rare or very rare** Dry mouth
- ▸ **Frequency not known** Cardiac arrest · congestive heart failure · extrapyramidal symptoms · fever · gynaecomastia · hepatitis · hyperglycaemia · hyperhidrosis · mood altered · photosensitivity reaction · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · vasculitis

Overdose In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.
- **HEPATIC IMPAIRMENT**

Dose adjustments In adults, manufacturers advise dose reduction—consult product literature.

- **RENAL IMPAIRMENT**

Dose adjustments In adults, manufacturers advise reduced initial dose (consult product literature).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet

Chapter 3
Respiratory system

CONTENTS

Respiratory system, drug delivery

23-May-2022

Inhalation

This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Children and their carers should be advised to follow manufacturers' instructions on the care and cleansing of inhaler devices.

Inhaler devices

EvGr In young children, a pressurised metered-dose inhaler should be used with a spacer; use of a facemask is required until the child can breathe reproducibly without it. A nebuliser may be required when these methods are ineffective.

In children over the age of 5 years with chronic asthma, a *pressurised metered-dose inhaler* used with a spacer (with or without a spacer for children over 12 years) is as effective as any other hand-held inhaler. A spacer should always be used if the patient is on a high dose of inhaled corticosteroid.

In children over the age of 5 years with mild and moderate acute asthma attacks, a pressurised metered-dose inhaler with a spacer is at least as effective as nebulisation. A

By the age of 3 years, a child can usually be taught to use a spacer device without a mask. As soon as a child is able to use the mouthpiece, then this is the preferred delivery system. When a pressurised metered-dose inhaler with a spacer is unsuitable or inconvenient, a *dry-powder inhaler* or *breath-actuated inhaler* may be used instead if the child is able to use the device effectively. EvGr Consider the child's preference when testing alternative devices to a pressurised metered-dose inhaler; there is no evidence to dictate an order in which devices should be tested. A

Dry powder inhalers may be useful in children over 5 years, who are unwilling or unable to use a pressurised metered-dose inhaler with a spacer device; *breath-actuated inhalers* may be useful in older children if they are able to use the device effectively. The child or child's carer should be instructed carefully on the use of the inhaler. It is important to check that the inhaler is being used correctly; poor inhalation technique may be mistaken for a lack of response to the drug.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, the child may notice a lack of sensation in the mouth and throat previously associated with each actuation; coughing may occur more frequently following use of a dry-powder inhaler.

CFC-free metered-dose inhalers should be cleaned **weekly** according to the manufacturer's instructions.

EvGr Children, and their parents or carers should be instructed carefully on the use of the inhaler. It is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug. The number and different types of inhalers given to a child should be minimised. To help reduce confusion and ensure children receive inhalers they have been given training for, specify brand and inhaler when prescribing. A

MHRA/CHM advice: Pressurised metered dose inhalers (pMDI): risk of airway obstruction from aspiration of loose objects (July 2018)

The MHRA have received reports of patients who have inhaled objects into the back of the throat—in some cases objects were aspirated, causing airway obstruction. Patients should be reminded to remove the mouthpiece cover fully, shake the device and check that both the outside and inside of the mouthpiece are clear and undamaged before inhaling a dose, and to store the inhaler with the mouthpiece cover on.

Spacer devices

Spacer devices are particularly useful for infants, for children with poor inhalation technique, or for nocturnal asthma, because the device reduces the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Smaller-volume spacers may be more manageable for pre-school children and infants. The spacer device used must be compatible with the prescribed metered-dose inhaler.

Use and care of spacer devices

The suitability of the spacer device should be carefully assessed; opening the one-way valve is dependent on the child's inspiratory flow. Some devices can be tipped to 45° to open the valve during inhaler actuation and inspiration to assist the child.

Inhalation from the spacer device should follow the actuation as soon as possible because the drug aerosol is very short-lived. The total dose (which may be more than a single puff) should be administered as single actuations (with tidal breathing for 10–20 seconds or 5 breaths for each actuation) for children with good inspiratory flow. Larger doses may be necessary for a child with acute bronchospasm.

The device should be cleansed once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Nebulisers

NHS England and NHS Improvement have issued a national patient safety alert (NPSA) regarding the inadvertent use of piped medical air via a flowmeter to drive the administration of nebulised medication. For further information, see NHS England and NHS Improvement NPSA: **Eliminating the risk of inadvertent connection to medical air via a flowmeter** (available at: www.england.nhs.uk/publication/national-patient-safety-alert-eliminating-the-risk-of-inadvertent-connection-to-medical-air-via-a-flowmeter/).

Solutions for nebulisation used in severe and life-threatening asthma attacks are administered over 5–10 minutes from a nebuliser, usually driven by oxygen.

EvGr Children with a severe acute or life-threatening attack of asthma should preferably have oxygen during nebulisation since beta$_2$ agonists can increase arterial hypoxaemia. A

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are:

- to deliver a beta$_2$ agonist or ipratropium bromide p. 167 to a child with an *acute exacerbation* of asthma or of airways obstruction;
- to deliver *prophylactic medication* to a child unable to use other conventional devices;
- to deliver an antibacterial (such as colistimethate sodium p. 397 or tobramycin p. 355) to a child with chronic purulent infection (as in cystic fibrosis or bronchiectasis);
- to deliver budesonide p. 174 to a child with severe croup.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30% it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or it is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on particle size. Particles with a median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma whereas a particle size of 1–2 microns is needed for alveolar deposition. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

When a nebuliser is prescribed, the child or child's carer must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (and on peak-flow monitoring);
- be instructed not to treat acute attacks without also seeking medical help;
- have regular follow up with doctor or specialist nurse.

Jet nebulisers

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum flow rate of 6–8 litres/minute and can be driven by air or oxygen; in acute asthma the nebuliser should always be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

Some jet nebulisers are able to increase drug output during inspiration and hence increase efficiency.

Safe practice

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

Oral

Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Oral corticosteroids, theophylline p. 183, and leukotriene receptor antagonists are sometimes required for the management of asthma.

Parenteral

Drugs such as beta$_2$ agonists, corticosteroids, and aminophylline p. 182 can be given by injection in acute severe asthma when drug administration by nebulisation is inadequate or inappropriate; in these circumstances the child should generally be treated in a high dependency or intensive care unit.

Peak flow meters

Peak flow meters may be used to assess lung function in children over 5 years with asthma, but symptom monitoring is the most reliable assessment of asthma control. They are best used for short periods to assess the severity of asthma and to monitor response to treatment; continuous use of peak flow meters may detract from compliance with inhalers.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

3M Security Print and Systems Limited. Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112

GP practices can obtain supplies through their Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com.

In Scotland, peak flow charts can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

1 Airways disease, obstructive

Asthma, chronic

22-Dec-2021

Description of condition

Asthma is a common chronic inflammatory condition of the airways, associated with airway hyperresponsiveness and variable airflow obstruction. The most frequent symptoms of asthma are cough, wheeze, chest tightness, and breathlessness. Asthma symptoms vary over time and in intensity and can gradually or suddenly worsen, provoking an acute asthma attack that, if severe, may require hospitalisation.

Aims of treatment

The aim of treatment is to achieve control of asthma. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, normal lung function (in practical terms forced expiratory volume in 1 second (FEV_1) and/or peak expiratory flow (PEF) > 80% predicted or best), and minimal side-effects from treatment. In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control.

Lifestyle changes

EvGr Weight loss in overweight patients may lead to an improvement in asthma symptoms. Patients with asthma and parents of children with asthma should be advised about the dangers of smoking, to themselves and to their children,

and be offered appropriate support to stop smoking. Ⓐ For further information, see Smoking cessation p. 330.

Management

EvGr A stepwise approach aims to stop symptoms quickly and to improve peak flow. Treatment should be started at the level most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by stepping up treatment as necessary and decreasing treatment when control is good. Before initiating a new drug or adjusting treatment, consider whether the diagnosis is correct, check adherence and inhaler technique, and eliminate trigger factors for acute attacks.

A self-management programme comprising of a written personalised action plan and education should be offered to all patients with asthma (and/or their family or carers), and should be supported with regular review from a healthcare professional. Ⓐ

For information on devices used in the management of asthma, see Respiratory system, drug delivery p. 159.

Recommendations on the management of chronic asthma from the *National Institute for Health and Care Excellence (NICE)—Asthma: diagnosis, monitoring and chronic asthma management guidelines (NG*80*, November* 2017*), and British Thoracic Society (BTS) and Scottish Intercollegiate Guidelines Network (SIGN)—British guideline on the management of asthma (SIGN* 158*, July* 2019*)* differ significantly. Recommendations in BNF publications are based on NICE guidelines, and differences with BTS/SIGN (2019) have been highlighted.

For information on the management of patients during the COVID-19 pandemic, see COVID-19 p. 456.

Child aged over 16 years

NICE (2017) treatment recommendations for child aged over 16 years apply to patients aged 17 years and over. BTS/SIGN (2019) treatment recommendations for child aged over 16 years are the same as those for patients aged over 12 years (see child aged over 5 years section).

Intermittent reliever therapy

EvGr Start an inhaled short-acting beta$_2$ agonist (such as salbutamol p. 170 or terbutaline sulfate p. 172), to be used as required in all patients with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Patients using more than one short-acting beta$_2$ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. Ⓐ

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid (ICS) doses for children aged over 16 years as low, moderate, or high. BTS/SIGN (2019) instead define ICS doses for children aged over 16 years as low, medium or high (refer to individual guidelines for ICS dosing information).

EvGr A low-dose of ICS should be started as maintenance therapy in patients who present with any one of the following features: using an inhaled short-acting beta$_2$ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. BTS/SIGN (2019) also recommend initiation in patients who have had an asthma attack in the last 2 years, and starting an ICS at a dose appropriate to the severity of asthma.

BTS/SIGN (2019) recommend that inhaled corticosteroids (except ciclesonide p. 176) should initially be taken twice daily, however the same total daily dose taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of ICS should be adjusted over time to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2019) recommend the prescribing of inhalers by brand. Ⓐ

Initial add-on therapy

EvGr If asthma is uncontrolled on a low-dose of ICS as maintenance therapy, a leukotriene receptor antagonist (LTRA— such as montelukast p. 181) should be offered in addition to the ICS, and the response to treatment reviewed in 4 to 8 weeks.

BTS/SIGN (2019) instead recommend a long-acting beta$_2$ agonist (LABA—such as salmeterol p. 169 or formoterol fumarate p. 168) as initial add-on therapy to low-dose ICS if asthma is uncontrolled. This can be given as either a fixed-dose ICS and LABA regimen, or a MART regimen (Maintenance And Reliever Therapy—a combination of an ICS and a fast-acting LABA such as formoterol in a single inhaler, see budesonide with formoterol p. 175). Combination inhalers containing both a LABA and an ICS are recommended to improve adherence, and ensure that the LABA is not taken alone without the ICS.

BTS/SIGN (2019) also recommend that a MART regimen should be considered in children with a history of asthma attacks on a medium-dose ICS alone, or on a fixed-dose ICS and LABA regimen. Ⓐ

Additional controller therapies

EvGr If asthma is uncontrolled on a low-dose of ICS and a LTRA as maintenance therapy, a LABA in combination with the ICS should be offered with or without continued LTRA treatment, depending on the response achieved from the LTRA.

If asthma remains uncontrolled, offer to change the ICS and LABA maintenance therapy to a MART regimen with a low-dose of ICS as maintenance. See budesonide with formoterol p. 175.

If asthma remains uncontrolled on a MART regimen with a low-dose of ICS as maintenance with or without a LTRA, consider increasing to a moderate-dose of ICS (either continuing a MART regimen, or changing to a fixed-dose regimen of an ICS and a LABA with a short-acting beta$_2$ agonist as reliever therapy).

If asthma is still uncontrolled in patients on a moderate-dose of ICS as maintenance with a LABA (either as a MART or a fixed-dose regimen), with or without a LTRA, consider the following options:

- Increasing the ICS dose to a high-dose as maintenance (this should only be offered as part of a fixed-dose regimen with a short-acting beta$_2$ agonist used as reliever therapy), or
- A trial of an additional drug, for example, a long-acting muscarinic receptor antagonist (such as tiotropium) or modified-release theophylline p. 183, or
- Seeking advice from an asthma specialist.

BTS/SIGN (2019) instead recommend that if the patient is gaining some benefit from addition of a LABA but control remains inadequate, the LABA should be continued and *either* the dose of ICS be increased to a medium-dose (if not already on this dose), or a LTRA be added.

If there is no response to the LABA, consider discontinuing it and either increasing the dose of the ICS to a medium-dose (if not already on this dose), or adding a LTRA.

BTS/SIGN (2019) recommend that all patients whose asthma is not adequately controlled on recommended initial add-on therapy or additional controller therapies, should be referred for specialist asthma care. Ⓐ

High-dose ICS and further add-on treatment (specialist therapies)

EvGr Under specialist care, BTS/SIGN (2019) recommend that if asthma control remains inadequate on a medium-dose of ICS, plus a LABA or LTRA, the following interventions can be considered:

- Increasing the ICS to a high-dose—with high doses of ICS via a pressurised metered dose inhaler (pMDI) a spacer should be used, or
- Adding a LTRA (if not already tried), or modified-release theophylline p. 183, or tiotropium p. 167.

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of ICS, reduce to the original dose). Ⓐ

Continuous or frequent use of oral corticosteroids (specialist therapies)

EvGr Under specialist care, BTS/SIGN (2019) recommend adding a regular oral corticosteroid (prednisolone p. 508) at the lowest dose to provide adequate control in patients with very severe asthma uncontrolled on a high-dose ICS, and who have also tried (or are still receiving) a LABA, LTRA, tiotropium p. 167, or modified-release theophylline p. 183. Ⓐ

For information on the general use and side effects of corticosteroids, see Corticosteroids, general use p. 500. For information on the cessation of oral corticosteroid treatment, see *Treatment cessation* for systemic corticosteroids (such as prednisolone).

Monoclonal antibodies and immunosuppressants (specialist therapies)

EvGr Monoclonal antibodies such as omalizumab p. 180 and dupilumab p. 839 can be considered in certain children with severe asthma to achieve control and reduce the use of oral corticosteroids; immunosuppressants such as methotrexate [unlicensed] may also be considered as recommended by BTS/SIGN (2019). Ⓐ

For further guidance on monoclonal antibodies for the treatment of difficult and severe asthma, see NICE pathway: **Asthma** (available at: pathways.nice.org.uk/pathways/asthma/).

Child aged over 5 years

For children aged over 5 years, NICE (2017) treatment recommendations for children apply to children aged 5–16 years, and child over 16 years treatment recommendations apply to those aged 17 years and over. Whereas, for children aged over 5 years, BTS/SIGN (2019) treatment recommendations for children apply to children aged 5–12 years, and child over 16 years treatment recommendations apply to those aged over 12 years.

Intermittent reliever therapy

EvGr Start an inhaled short-acting beta$_2$ agonist (such as salbutamol p. 170 or terbutaline sulfate p. 172), to be used as required in all children with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Children using more than one short-acting beta$_2$ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. Ⓐ

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid (ICS) doses for children (aged 5–16 years) as paediatric low, moderate, or high. BTS/SIGN (2019) instead define ICS doses for children (aged 5–12 years) as very low, low, or medium, and for children over 12 years as low, medium or high (refer to individual guidelines for ICS dosing information).

EvGr A paediatric low-dose of ICS should be started as maintenance therapy in children who present with any one of the following features: using an inhaled short-acting beta$_2$ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week.

BTS/SIGN (2019) instead recommend starting a very low-dose (child aged 5–12 years) or a low-dose (child aged over 12 years) of ICS in children presenting with any one of the following features: using an inhaled short-acting beta$_2$ agonist three times a week or more, symptomatic three times a week or more, waking at night due to asthma symptoms at least once a week, or have had an asthma attack in the last 2 years, and starting an ICS at a dose appropriate to the severity of asthma.

BTS/SIGN (2019) recommend that inhaled corticosteroids (except ciclesonide p. 176) should initially be taken twice daily, however the same total daily dose taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of ICS should be adjusted over time to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2019) recommend the prescribing of inhalers by brand. Ⓐ

Initial add-on therapy

EvGr If asthma is uncontrolled on a paediatric low-dose of ICS as maintenance therapy, consider a leukotriene receptor antagonist (LTRA—such as montelukast p. 181) in addition to the ICS, and review the response to treatment in 4 to 8 weeks.

BTS/SIGN (2019) instead recommend a long-acting beta$_2$ agonist (LABA—such as salmeterol p. 169 or formoterol fumarate p. 168) as initial add-on therapy to low-dose ICS if asthma is uncontrolled in children aged over 12 years. This can be given as either a fixed-dose ICS and LABA regimen, or a MART regimen (Maintenance And Reliever Therapy—a combination of an ICS and a fast-acting LABA such as formoterol in a single inhaler, see budesonide with formoterol p. 175). Combination inhalers containing both a LABA and an ICS are recommended to improve adherence, and ensure that the LABA is not taken alone without the ICS.

BTS/SIGN (2019) also recommend that a MART regimen should be considered in children aged over 12 years with a history of asthma attacks on a medium-dose ICS alone, or on a fixed-dose ICS and LABA regimen.

In children aged 5–12 years, BTS/SIGN (2019) recommend the addition of a LABA or a LTRA, as an initial add-on therapy to very low-dose ICS if asthma is uncontrolled. Ⓐ

Additional controller therapies

EvGr If asthma is uncontrolled on a paediatric low-dose of ICS and a LTRA as maintenance therapy, consider discontinuation of the LTRA and initiation of a LABA in combination with the ICS.

If asthma remains uncontrolled on a paediatric low-dose of ICS and a LABA as maintenance therapy, consider changing to a MART regimen (Maintenance And Reliever Therapy—a combination of an ICS and fast-acting LABA such as formoterol in a single inhaler) with a paediatric low-dose of ICS as maintenance. See budesonide with formoterol p. 175 [not licensed in all age groups].

If asthma remains uncontrolled on a MART regimen with a paediatric low-dose of ICS as maintenance, consider increasing to a paediatric moderate-dose of ICS (either continuing a MART regimen, or changing to a fixed-dose regimen of an ICS and a LABA with a short-acting beta$_2$ agonist as reliever therapy).

If asthma is still uncontrolled on a paediatric moderate-dose of ICS as maintenance with a LABA (either as a MART or a fixed-dose regimen), consider seeking advice from an asthma specialist and the following options:

- Increasing the ICS dose to a paediatric high-dose as maintenance (this should only be offered as part of a fixed-dose regimen with a short-acting beta$_2$ agonist as reliever therapy), or
- A trial of an additional drug, such as modified-release theophylline p. 183.

BTS/SIGN (2019) instead recommend that in children aged 5-12 years who are gaining some benefit from the addition of a LABA or a LTRA but control remains inadequate, to continue the LABA or LTRA and *either* increase the dose of the ICS to a low-dose (if not already on this dose), or adding a LTRA or LABA (whichever is not being used).

In children aged over 12 years, BTS/SIGN (2019) recommend continuing the LABA and *either* increasing the ICS to a medium-dose (if not already on this dose), or adding a LTRA.

If there is no response to the LABA, consider discontinuing it and *either* increasing the dose of ICS to a low-dose (child 5–12 years) or medium-dose (child over 12 years) if not already on this dose, or adding a LTRA.

BTS/SIGN (2019) recommend that all children whose asthma is not adequately controlled on recommended initial add-on therapy or additional controller therapies, should be referred for specialist asthma care. A

High-dose ICS and further add-on treatment (specialist therapies)

EvGr Under specialist care, BTS/SIGN (2019) recommend that if control remains inadequate on a low-dose (child aged 5–12 years) or medium-dose (child aged over 12 years) of ICS, plus a LABA or LTRA, the following interventions can be considered:

- Increasing the ICS dose to a medium-dose (child aged 5–12 years) or high-dose (child aged over 12 years)—with ICS via a pressurised metered dose inhaler (pMDI), a spacer should be used, or
- Adding a LTRA (if not already tried), or modified-release theophylline p. 183, or tiotropium p. 167 (in children over 12 years).

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of ICS, reduce to the original dose). A

Continuous or frequent use of oral corticosteroids (specialist therapies)

EvGr Under specialist care, BTS/SIGN (2019) recommend adding a regular oral corticosteroid (prednisolone p. 508) at the lowest dose to provide adequate control in children with very severe asthma uncontrolled on a high-dose ICS, and who have also tried (or are still receiving) a LABA, LTRA, tiotropium p. 167 (child aged over 12 years), or modified-release theophylline p. 183. A

For information on the general use and side effects of corticosteroids, see Corticosteroids, general use p. 500. For information on the cessation of oral corticosteroid treatment, see *Treatment cessation* for systemic corticosteroids (such as prednisolone).

Monoclonal antibodies and immunosuppressants (specialist therapies)

EvGr Monoclonal antibodies such as omalizumab p. 180 and dupilumab p. 839 can be considered in certain children with severe asthma to achieve control and reduce the use of oral corticosteroids; immunosuppressants such as methotrexate [unlicensed] may also be considered as recommended by BTS/SIGN (2019). A

For further guidance on monoclonal antibodies for the treatment of difficult and severe asthma, see NICE pathway: **Asthma** (available at: pathways.nice.org.uk/pathways/asthma/).

Child aged under 5 years

Intermittent reliever therapy

EvGr A short-acting beta$_2$ agonist (such as salbutamol p. 170) as reliever therapy should be offered to children aged under 5 years with suspected asthma. A short-acting beta$_2$ agonist should be used for symptom relief alongside maintenance treatment.

Children using more than one short-acting beta$_2$ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. A

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid (ICS) doses for children aged under 5 years as paediatric low or moderate. BTS/SIGN (2019) instead define ICS doses for children aged under 5 years as very low (refer to individual guidelines for ICS dosing information).

EvGr Consider an 8-week trial of a paediatric moderate-dose of ICS in children presenting with any of the following features: asthma-related symptoms three times a week or more, experiencing night-time awakening at least once a week, or suspected asthma that is uncontrolled with a short-acting beta$_2$ agonist alone.

After 8 weeks, stop ICS treatment and continue to monitor the child's symptoms:

- If symptoms did not resolve during the trial period, review whether an alternative diagnosis is likely;
- If symptoms resolved then reoccurred within 4 weeks of stopping ICS treatment, restart the ICS at a paediatric low-dose as first-line maintenance therapy;
- If symptoms resolved but reoccurred beyond 4 weeks after stopping ICS treatment, repeat the 8-week trial of a paediatric moderate-dose of ICS.

BTS/SIGN (2019) instead recommend starting a very low-dose of ICS as initial regular preventer therapy in children presenting with any one of the following features: using an inhaled short-acting beta$_2$ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. In children unable to take an ICS, a leukotriene receptor antagonist (LTRA, such as montelukast p. 181) may be used as an alternative.

BTS/SIGN (2019) recommend the prescribing of inhalers by brand. A

Initial add-on therapy

EvGr If suspected asthma is uncontrolled in children aged under 5 years on a paediatric low-dose of ICS as maintenance therapy, consider a LTRA in addition to the ICS.

If suspected asthma is uncontrolled in children aged under 5 years on a paediatric low-dose of ICS and a LTRA as maintenance therapy, stop the LTRA and refer the child to an asthma specialist. A

Decreasing treatment

EvGr Consider decreasing maintenance therapy when a patient's asthma has been controlled with their current maintenance therapy for at least three months. When deciding which drug to decrease first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effect achieved, and the patient's preference should be considered. Patients should be regularly reviewed when decreasing treatment.

Patients should be maintained at the lowest possible dose of ICS. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as patients deteriorate at different rates. Only consider stopping ICS treatment completely for people who are using a paediatric or adult low-dose ICS alone as maintenance therapy and are symptom-free. A

Exercise-induced asthma

EvGr For most patients, exercise-induced asthma is an illustration of poorly controlled asthma and regular treatment including an ICS should therefore be reviewed. If exercise is a specific problem in patients already taking an ICS who are otherwise well controlled, consider adding either a LTRA, a long-acting beta$_2$ agonist, sodium cromoglicate p. 182 or nedocromil sodium, or theophylline p. 183. An inhaled short-acting beta$_2$ agonist used immediately before exercise is the drug of choice. A

Pregnancy

EvGr Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma is well controlled during pregnancy; when this is achieved there is little or no increased risk of adverse maternal or fetal complications.

Women should be counselled about the importance and safety of taking their asthma medication during pregnancy to maintain good control. Women who smoke should be advised about the dangers to themselves and to their baby

and be offered appropriate support to stop smoking. Ⓐ For further information, see Smoking cessation p. 330.

EvGr Short-acting beta$_2$ agonists, LABAs, oral and inhaled corticosteroids, sodium cromoglicate p. 182 and nedocromil sodium, and oral and intravenous theophylline p. 183 (with appropriate monitoring) can be used as normal during pregnancy. There is limited information on use of a LTRA during pregnancy, however, where indicated to achieve adequate control, they should not be withheld. Ⓐ

Advanced Pharmacy Services

Patients with asthma may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

Asthma, acute

17-May-2021

Description of condition

Acute asthma is the progressive worsening of asthma symptoms, including breathlessness, wheeze, cough, and chest tightness. An acute exacerbation is marked by a reduction in baseline objective measures of pulmonary function, such as peak expiratory flow rate and FEV_1.

Most asthma attacks severe enough to require hospitalisation develop relatively slowly over a period of six hours or more. In children, intermittent wheezing attacks are usually triggered by viral infections and response to asthma medication may be inconsistent. Low birth weight and/or prematurity may be risk factors for recurrent wheeze.

Aims of treatment

The aim of treatment is to relieve airflow obstruction and prevent future relapses. Early treatment is most advantageous.

Levels of severity

Children

EvGr An acute exacerbation of asthma should be correctly differentiated from poor asthma control and its severity categorised in order to be appropriately treated. The categories are described as follows: Ⓐ

Moderate acute asthma

- Able to talk in sentences;
- Arterial oxygen saturation (SpO_2) $\geq$ 92%;
- Peak flow $\geq$ 50% best or predicted;
- Heart rate $\leq$ 140/minute in children aged 1–5 years; heart rate $\leq$ 125/minute in children aged over 5 years;
- Respiratory rate $\leq$ 40/minute in children aged 1–5 years; respiratory rate $\leq$ 30/minute in children aged over 5 years.

Severe acute asthma

- Can't complete sentences in one breath or too breathless to talk or feed;
- $SpO_2 <$ 92%;
- Peak flow 33–50% best or predicted;
- Heart rate $>$ 140/minute in children aged 1–5 years; heart rate $>$ 125/minute in children aged over 5 years;
- Respiratory rate $>$ 40/minute in children aged 1–5 years; respiratory rate $>$ 30/minute in children aged over 5 years.

Life-threatening acute asthma

Any one of the following in a child with severe asthma:

- $SpO_2 <$ 92%;
- Peak flow $<$ 33% best or predicted;
- Silent chest;
- Cyanosis;
- Poor respiratory effort;
- Hypotension;
- Exhaustion;
- Confusion.

Management in children aged 2 years and over

EvGr Children with features of **severe** or **life-threatening** acute asthma should start treatment as soon as possible and be referred to hospital immediately following initial assessment.

Any child who fails to respond to treatment adequately at any time should also be referred to hospital immediately.

Supplementary high flow oxygen (via a tight-fitting face mask or nasal cannula) should be given to all children with life-threatening acute asthma or $SpO_2 <$ 94% to achieve normal saturations of 94–98%.

First-line treatment for acute asthma is an inhaled short-acting beta$_2$ agonist (such as salbutamol p. 170) given as soon as possible. For children with mild to moderate acute asthma, a pressurised metered-dose inhaler and spacer device is the preferred option. The dose given should be individualised according to severity and adjusted based on response. For children with acute severe or life-threatening symptoms, administration via an oxygen-driven nebuliser is recommended, if available. Parents/carers of children with acute asthma at home, should seek urgent medical attention if initial symptoms are not controlled with up to 10 puffs of salbutamol via a spacer; if symptoms are severe, additional bronchodilator doses should be given as needed whilst awaiting medical attention. Urgent medical attention should also be sought if a child's symptoms return within 3-4 hours; if symptoms return within this time, a further or larger dose (maximum of 10 puffs of salbutamol via a spacer) should be given whilst awaiting medical attention.

In all cases of acute asthma, children should be prescribed an adequate dose of oral prednisolone p. 508. Treatment for up to 3 days is usually sufficient, but the length of the course should be tailored to the number of days necessary to bring about recovery. Repeat the dose in children who vomit and consider the intravenous route in those who are unable to retain oral medication. It is considered good practice that inhaled corticosteroids are continued at their usual maintenance dose whilst receiving additional treatment for the attack, but they should not be used as a replacement for the oral corticosteroid. Ⓐ

For information on the general use and side-effects of corticosteroids, see Corticosteroids, general use p. 500. For information on the cessation of oral corticosteroid treatment, see *Treatment cessation* for systemic corticosteroids (such as prednisolone).

EvGr Nebulised ipratropium bromide p. 167 can be combined with a nebulised beta$_2$ agonist for children with a poor initial response to beta$_2$ agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate p. 682 [unlicensed use] to each nebulised salbutamol and ipratropium bromide in the first hour in children with a short duration of severe acute asthma symptoms presenting with an oxygen saturation less than 92%.

Children with continuing severe acute asthma despite frequent nebulised beta$_2$ agonists and ipratropium bromide

plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In children who respond poorly to first-line treatments, intravenous magnesium sulfate [unlicensed use] may be considered as first-line intravenous treatment. In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in children with unreliable inhalation or severe refractory asthma. Intravenous aminophylline p. 182 may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids. A

Management in children aged under 2 years

EvGr Acute asthma treatment for all children aged under 2 years should be given in the hospital setting. Treatment of children aged under 1 year should be under the direct guidance of a respiratory paediatrician.

For moderate and severe acute asthma attacks, immediate treatment with oxygen via a tight-fitting face mask or nasal prongs should be given to achieve normal SpO_2 saturations of 94-98%. Trial an inhaled short-acting $beta_2$ agonist and if response is poor, combine nebulised ipratropium bromide to each nebulised $beta_2$ agonist dose. Consider oral prednisolone daily for up to 3 days, early in the management of severe asthma attacks.

In children not responsive to first-line treatments or have life-threatening features, discuss management with a senior paediatrician or the PICU team. A

Follow up in all cases

EvGr Episodes of acute asthma may be a failure of preventative therapy, review is required to prevent further episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be checked and regular treatment should be reviewed. Children and their parents or carers should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the child's GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack, and the child be reviewed by their GP within 2 working days. Children who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all children admitted with a severe asthma attack for at least one year after the admission. A

Advanced Pharmacy Services

Children with asthma may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 23.

Useful Resources

British guideline on the management of asthma. British Thoracic Society and Scottish Intercollegiate Guidelines Network. Full guidance - A national clinical guideline 158. July 2019.
www.sign.ac.uk/sign-158-british-guideline-on-the-management-of-asthma

Oxygen

Overview

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; administration of an inappropriate concentration of oxygen may have serious or even fatal consequences. High concentrations of oxygen can cause pulmonary epithelial damage (bronchopulmonary dysplasia), convulsions, and retinal damage, especially in preterm neonates.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation. In most acutely ill children with an expected or known normal or low arterial carbon dioxide ($P_a CO_2$), oxygen saturation should be maintained above 92%; some clinicians may aim for a target of 94–98%. In some clinical situations, such as carbon monoxide poisoning, it is more appropriate to aim for the highest possible oxygen saturation until the child is stable. Hypercapnic respiratory failure is rare in children; in those children at risk, a lower oxygen saturation target of 88–92% is indicated.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_a O_2$) is usually associated with low or normal arterial carbon dioxide ($P_a CO_2$), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In severe acute asthma, the arterial carbon dioxide ($P_a CO_2$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_a CO_2$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Oxygen should not be given to neonates except under expert supervision. Particular care is required in preterm neonates because of the risk of hyperoxia.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for children at risk of hypercapnic respiratory failure, which is more likely in children with:

- advanced cystic fibrosis;
- advanced non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target concentration of 88–92%. The aim is to provide the child with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an *oxygen alert card*.

The oxygen alert card template is available at www.brit-thoracic.org.uk.

Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by a respiratory care specialist. Carers and children who smoke should be advised of the risks of smoking when receiving oxygen, including the risk of fire. Smoking cessation p. 330 therapy should be recommended before home oxygen prescription.

Long-term oxygen therapy

The aim of long-term oxygen therapy is to maintain oxygen saturation of at least 92%. Children (especially those with chronic neonatal lung disease) often require supplemental oxygen, either for 24-hours a day or during periods of sleep; many children are eventually weaned off long-term oxygen therapy as their condition improves.

Long-term oxygen therapy should be considered for children with conditions such as:

- bronchopulmonary dysplasia (chronic neonatal lung disease);
- congenital heart disease with pulmonary hypertension;
- pulmonary hypertension secondary to pulmonary disease;
- idiopathic pulmonary hypertension;
- sickle-cell disease with persistent nocturnal hypoxia;
- interstitial lung disease and obliterative bronchiolitis;
- cystic fibrosis;
- obstructive sleep apnoea syndrome;
- neuromuscular or skeletal disease requiring non-invasive ventilation;
- pulmonary malignancy or other terminal disease with disabling dyspnoea.

Increased respiratory depression is seldom a problem in children with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; children and their carers should be warned to call for medical help if drowsiness or confusion occurs.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness.

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for children on long-term oxygen therapy who need to be away from home on a regular basis.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as **oxygen cylinders**. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for children who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a child who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a 'Y' connection.

A nasal cannula is usually preferred to a face mask for long-term oxygen therapy from an oxygen concentrator. Nasal cannulas can, however, cause dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the child to talk, eat, and drink, but the concentration of oxygen is not controlled and the method may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the consent of the child or carers to pass on the child's details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the child or carer to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the child or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the child no longer requires the home oxygen service.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989
- South West: Air Liquide: Tel: 0808 202 2229 Fax: 0191 497 4340
- London East, Midlands, North West: Air Liquide: Tel: 0500 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 214 709
- South East Coast, South Central: Dolby Vivisol: Tel: 08443 814 402 Fax: 0800 781 4610

In **Scotland** refer the child for assessment by a paediatric respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their contractor to arrange the supply of oxygen. Further information can be obtained at www.dolbyvivisol.com/services/healthcare-professionals/.

In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

Croup

21-Oct-2020

Management

EvGr Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 504) by mouth may be of benefit.

Moderate to severe croup (or mild croup that might cause complications such as in those with chronic lung disease, immunodeficiency, impending respiratory failure, or in children aged under 3 months) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 508 by mouth) should be administered while awaiting hospital admission. If the child is too unwell to receive oral medication, dexamethasone (by intramuscular injection) or budesonide p. 174 (by nebulisation) are suitable alternatives while awaiting hospital admission.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine solution 1 in 1000 (1 mg/mL) p. 149 should be given with close clinical monitoring; A the clinical effects of nebulised adrenaline/epinephrine last at least 1 hour, but usually subside 2 hours after administration. EvGr The child needs to be monitored carefully for recurrence of severe respiratory distress. A

Ipratropium bromide

05-May-2021

- **INDICATIONS AND DOSE**

Reversible airways obstruction

- BY INHALATION OF AEROSOL
  - Child 1 month–5 years: 20 micrograms 3 times a day
  - Child 6–11 years: 20–40 micrograms 3 times a day
  - Child 12–17 years: 20–40 micrograms 3–4 times a day

Acute bronchospasm

- BY INHALATION OF NEBULISED SOLUTION
  - Child 1 month–5 years: 125–250 micrograms as required; maximum 1 mg per day
  - Child 6–11 years: 250 micrograms as required; maximum 1 mg per day
  - Child 12–17 years: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day

Severe or life-threatening acute asthma

- BY INHALATION OF NEBULISED SOLUTION
  - Child 1 month–11 years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
  - Child 12–17 years: 500 micrograms every 4–6 hours as required

PHARMACOKINETICS

- The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

- **UNLICENSED USE** EvGr The dose of ipratropium for severe or life-threatening acute asthma is unlicensed. A *Inhalvent*® not licensed for use in children under 6 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 159.

- **CAUTIONS** Avoid spraying near eyes · cystic fibrosis

CAUTIONS, FURTHER INFORMATION

- Glaucoma *Acute angle-closure glaucoma* has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta$_2$ agonists); care needed to protect the patient's eyes from nebulised drug or from drug powder.

- **INTERACTIONS** → Appendix 1: ipratropium
- **SIDE-EFFECTS**
  - **Common or very common** Gastrointestinal motility disorder · throat complaints
  - **Uncommon** Corneal oedema · diarrhoea · eye disorders · eye pain · respiratory disorders · vision disorders · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to atropine or its derivatives.
- **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.
- **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises if dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).

  Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and vision disorders.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

- **Ipratropium bromide (Non-proprietary)**
  Ipratropium bromide 250 microgram per 1 ml Ipratropium bromide 500micrograms/2ml nebuliser liquid unit dose vials | 20 unit dose PoM £4.99 DT = £2.85

BETA$_2$-ADRENOCEPTOR AGONISTS, SELECTIVE

Beta$_2$-adrenoceptor agonists, selective

12-Feb-2016

- **CAUTIONS** Arrhythmias · cardiovascular disease · diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use) · hypertension · hyperthyroidism · hypokalaemia · susceptibility to QT-interval prolongation

  CAUTIONS, FURTHER INFORMATION
  - Hypokalaemia Potentially serious hypokalaemia may result from beta$_2$ agonist therapy. EvGr Particular caution is required in severe asthma or COPD, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia. M
- **SIDE-EFFECTS**
  - **Common or very common** Arrhythmias · headache · palpitations · tremor
  - **Uncommon** Hyperglycaemia
  - **Rare or very rare** Bronchospasm paradoxical (sometimes severe)
- **PREGNANCY** Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.
- **MONITORING REQUIREMENTS**
  - In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
  - In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta$_2$ agonist given intravenously).
- **PATIENT AND CARER ADVICE** The **dose**, the frequency, and the maximum number of inhalations in 24 hours of the beta$_2$ agonist should be **stated explicitly** to the patient or their carer. The patient or their carer should be advised to seek medical advice when the prescribed dose of beta$_2$ agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug. Patients or their carers should be advised to follow manufacturers' instructions on the care and cleansing of inhaler devices.

BETA$_2$-ADRENOCEPTOR AGONISTS, SELECTIVE › LONG-ACTING

Formoterol fumarate

(Eformoterol fumarate)

05-May-2021

- **INDICATIONS AND DOSE**

  Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid

  - BY INHALATION OF POWDER
  - Child 6–11 years: 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
  - Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-

groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

- BY INHALATION OF AEROSOL
- Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

OXIS ®

Chronic asthma

- BY INHALATION OF POWDER
- Child 6–17 years: 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day

Relief of bronchospasm

- BY INHALATION OF POWDER
- Child 6–17 years: 6–12 micrograms

Prophylaxis of exercise-induced bronchospasm

- BY INHALATION OF POWDER
- Child 6–17 years: 6–12 micrograms, dose to be taken before exercise

PHARMACOKINETICS

- At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

IMPORTANT SAFETY INFORMATION

CHM ADVICE

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting $beta_2$ agonist (formoterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 159.

- **INTERACTIONS** → Appendix 1: $beta_2$ agonists
- **SIDE-EFFECTS**

BETA$_2$-ADRENOCEPTOR AGONISTS, SELECTIVE › SHORT-ACTING

F 168

Salbutamol

(Albuterol)

11-Nov-2021

- **INDICATIONS AND DOSE**

Acute asthma

- BY INTRAVENOUS INJECTION
- Child 1-23 months: 5 micrograms/kg for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta$_2$ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- Child 2-17 years: 15 micrograms/kg (max. per dose 250 micrograms) for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta$_2$ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- BY CONTINUOUS INTRAVENOUS INFUSION
- Child: 1–2 micrograms/kg/minute, adjusted according to response and heart rate, increased if necessary up to 5 micrograms/kg/minute, doses above 2 micrograms/kg/minute should be given in an intensive care setting, reserve intravenous beta$_2$ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

Moderate, severe, or life-threatening acute asthma

- BY INHALATION OF NEBULISED SOLUTION
- Child 1 month-4 years: 2.5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- Child 5-11 years: 2.5–5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- Child 12-17 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Moderate and severe acute asthma

- BY INHALATION OF AEROSOL
- Child: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer (and a close-fitting face mask in children under 3 years), each puff is equivalent to 100 micrograms

Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prophylaxis of allergen- or exercise-induced bronchospasm

- BY INHALATION OF AEROSOL
- Child: 100–200 micrograms, up to 4 times a day for persistent symptoms
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 1 month-1 year: 100 micrograms/kg 3–4 times a day (max. per dose 2 mg), inhalation route preferred over oral route
- Child 2-5 years: 1–2 mg 3–4 times a day, inhalation route preferred over oral route
- Child 6-11 years: 2 mg 3–4 times a day, inhalation route preferred over oral route
- Child 12-17 years: 2–4 mg 3–4 times a day, inhalation route preferred over oral route

Severe hyperkalaemia

- BY INTRAVENOUS INJECTION
- Neonate: 4 micrograms/kg, repeated if necessary, to be administered over 5 minutes.
- Child: 4 micrograms/kg, repeated if necessary, to be administered over 5 minutes
- BY INHALATION OF NEBULISED SOLUTION
- Neonate: 2.5–5 mg, repeated if necessary, intravenous injection route preferred over inhalation of nebulised solution.
- Child: 2.5–5 mg, repeated if necessary, intravenous injection route preferred over inhalation of nebulised solution

EASYHALER® SALBUTAMOL

Acute bronchospasm

- BY INHALATION OF POWDER
- Child 5-11 years: 100–200 micrograms; maximum 800 micrograms per day
- Child 12-17 years: Initially 100–200 micrograms, increased if necessary to 400 micrograms; maximum 800 micrograms per day

Prophylaxis of allergen- or exercise-induced bronchospasm
- BY INHALATION OF POWDER
- Child 5–11 years: 100–200 micrograms
- Child 12–17 years: 200 micrograms

SALBULIN NOVOLIZER ®

Acute bronchospasm
- BY INHALATION OF POWDER
- Child 6–11 years: 100–200 micrograms, up to 400 micrograms daily for persistent symptoms
- Child 12–17 years: Initially 100–200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm
- BY INHALATION OF POWDER
- Child 6–11 years: 100–200 micrograms
- Child 12–17 years: 200 micrograms

VENTOLIN ACCUHALER ®

Acute bronchospasm
- BY INHALATION OF POWDER
- Child 5–17 years: Initially 200 micrograms, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm
- BY INHALATION OF POWDER
- Child 5–17 years: 200 micrograms

PHARMACOKINETICS
- At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

● **UNLICENSED USE** Not licensed for use in hyperkalaemia.
- With oral use Syrup and tablets not licensed for use in children under 2 years.
- With intravenous use Injection and solution for intravenous infusion not licensed for use in children under 12 years. Administration of undiluted salbutamol injection through a central venous catheter is not licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)
- When used by inhalation

See Respiratory system, drug delivery p. 159.

● **INTERACTIONS** → Appendix 1: beta$_2$ agonists

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS
- **Common or very common** Muscle cramps
- **Rare or very rare** Akathisia · hypokalaemia (with high doses) · vasodilation
- **Frequency not known** Metabolic change · myocardial ischaemia

SPECIFIC SIDE-EFFECTS
- **Uncommon**
- When used by inhalation Oral irritation · throat irritation
- With parenteral use Pulmonary oedema
- **Frequency not known**
- When used by inhalation Lactic acidosis (with high doses)
- With parenteral use Lactic acidosis (with high doses) · nausea · vomiting

● **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.

● **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For *continuous intravenous infusion*, dilute to a concentration of 200 micrograms/mL with Glucose 5% *or* Sodium Chloride 0.9%. If fluid-restricted, can be given undiluted through central venous catheter [unlicensed]. For *intravenous injection*, dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, *or* Water for injections.
- When used by inhalation For *nebulisation*, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.

● **PRESCRIBING AND DISPENSING INFORMATION**
- When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.

● **PATIENT AND CARER ADVICE**
- When used by inhalation *For inhalation by aerosol or dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. *For inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

Medicines for Children leaflet: Salbutamol inhaler for asthma and wheeze www.medicinesforchildren.org.uk/medicines/salbutamol-inhaler-for-asthma-and-wheeze/

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

168

Terbutaline sulfate

05-May-2021

INDICATIONS AND DOSE

Acute asthma

BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Child 2–14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous $beta_2$ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- Child 15–17 years: 250–500 micrograms up to 4 times a day, reserve intravenous $beta_2$ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

BY CONTINUOUS INTRAVENOUS INFUSION

- Child: Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous $beta_2$ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

Moderate, severe, or life-threatening acute asthma

BY INHALATION OF NEBULISED SOLUTION

- Child 1 month–4 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- Child 5–11 years: 5–10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- Child 12–17 years: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prevention of exercise-induced bronchospasm

BY INHALATION OF POWDER

- Child 5–17 years: 500 micrograms up to 4 times a day, for occasional use only

BY MOUTH

- Child 1 month–6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg), administration by mouth is not recommended
- Child 7–14 years: 2.5 mg 2–3 times a day, administration by mouth is not recommended
- Child 15–17 years: Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day, administration by mouth is not recommended

PHARMACOKINETICS

- At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.

UNLICENSED USE

- With oral use Tablets not licensed for use in children under 7 years.
- With intravenous use or subcutaneous use Injection not licensed for use in children under 2 years.

INTERACTIONS → Appendix 1: $beta_2$ agonists

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Hypokalaemia · hypotension · muscle spasms · nausea
- **Rare or very rare** Myocardial ischaemia · vasodilation
- **Frequency not known** Angioedema · anxiety · behaviour abnormal · bronchospasm · circulatory collapse · oral irritation · skin reactions · sleep disorder · throat irritation

SPECIFIC SIDE-EFFECTS

- **Uncommon**
- With parenteral use Pulmonary oedema
- **Rare or very rare**
- With parenteral use Lactic acidosis
- **Frequency not known**
- When used by inhalation Lactic acidosis (with high doses)
- With parenteral use Akathisia · bleeding tendency

PREGNANCY

Inhaled drugs for asthma can be taken as normal during pregnancy.

BREAST FEEDING

Inhaled drugs for asthma can be taken as normal during breast-feeding.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use EvGr For *continuous intravenous infusion*, dilute to a concentration of 3–5 micrograms/mL with Glucose 5% *or* Sodium Chloride 0.9%. M If fluid-restricted, expert sources advise dilute to a concentration of 100 micrograms/mL; give via a syringe pump.
- When used by inhalation EvGr For *nebulisation*, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution, if required, according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation. M

PRESCRIBING AND DISPENSING INFORMATION

- When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.

PATIENT AND CARER ADVICE

- When used by inhalation *For inhalation by dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. *For inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Bricanyl** (AstraZeneca UK Ltd)
  Terbutaline sulfate 5 mg Bricanyl 5mg tablets | 100 tablet PoM £14.73 DT = £14.73

Inhalation powder

- **Bricanyl Turbohaler** (AstraZeneca UK Ltd)
  Terbutaline sulfate 500 microgram per 1 dose Bricanyl 500micrograms/dose Turbohaler | 120 dose PoM £8.30 DT = £8.30

Solution for injection

- **Bricanyl** (AstraZeneca UK Ltd)
  Terbutaline sulfate 500 microgram per 1 ml Bricanyl 2.5mg/5ml solution for injection ampoules | 10 ampoule PoM £20.09 DT = £20.09
  Bricanyl 500micrograms/1ml solution for injection ampoules | 5 ampoule PoM £6.48 DT = £6.48

Nebuliser liquid

- **Terbutaline sulfate (Non-proprietary)**
  Terbutaline sulfate 2.5 mg per 1 ml Terbutaline 5mg/2ml nebuliser liquid unit dose vials | 20 unit dose PoM £6.21–£7.81 DT = £6.21
- **Bricanyl Respules** (AstraZeneca UK Ltd)
  Terbutaline sulfate 2.5 mg per 1 ml Bricanyl 5mg/2ml Respules | 20 unit dose PoM £11.64 DT = £6.21

CORTICOSTEROIDS

Corticosteroids (inhaled)

- **SIDE-EFFECTS**

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

PAEDIATRIC STEROID TREATMENT CARD FOR CHILDREN WITH ADRENAL INSUFFICIENCY (NOVEMBER 2020)

The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The BSPED Paediatric Steroid Treatment Card is available at: www.endocrinology.org/adrenal-crisis.

- **Common or very common** Headache · oral candidiasis · taste altered · voice alteration
- **Uncommon** Anxiety · bronchospasm paradoxical · cataract · vision blurred
- **Rare or very rare** Adrenal suppression · behaviour abnormal · glaucoma · growth retardation · sleep disorder
- **Frequency not known** Pneumonia (in patients with COPD)

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption may follow inhaled administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.

Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind. Mild bronchospasm may be prevented by inhalation of a short-acting beta$_2$ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.
- **MONITORING REQUIREMENTS** The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- **PATIENT AND CARER ADVICE** If systemic absorption occurs following inhaled use, side-effects applicable to systemic corticosteroids may apply.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  For full details see funding body website

NICE decisions

- **Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007)** NICE TA131 Recommended
- **Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008)** NICE TA138 Recommended

above

Beclometasone dipropionate

08-Mar-2022

(Beclomethasone dipropionate)

- **INDICATIONS AND DOSE**

Prophylaxis of asthma

- BY INHALATION OF POWDER
- Child 5-11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
- Child 12-17 years: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

- Dose adjustments may be required for some inhaler devices, see under individual preparations.

CLENIL MODULITE ®

Prophylaxis of asthma

- BY INHALATION OF AEROSOL
- Child 2-11 years: 100–200 micrograms twice daily
- Child 12-17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

QVAR ® PREPARATIONS

Prophylaxis of asthma

- BY INHALATION OF AEROSOL
- Child 5-11 years: 50–100 micrograms twice daily, using Autohaler or MDI device
- Child 12-17 years: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily, using Autohaler, MDI, or Easi-Breathe device

POTENCY

- *Qvar*® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers and is approximately twice as potent as *Clenil Modulite*®.

SOPROBEC ®

Prophylaxis of asthma

- BY INHALATION OF AEROSOL
- Child: 100 micrograms twice daily; increased if necessary up to 400 micrograms daily in 2–4 divided doses

● **UNLICENSED USE** *Easyhaler® Beclometasone Dipropionate* is not licensed for use in children. *Clenil Modulite®* 200 and 250 are not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JULY 2008)

Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (*Qvar®* and *Clenil Modulite®*) are **not** interchangeable and should be prescribed by brand name; *Qvar®* has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as *Clenil Modulite®*.

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 159.

● **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS**

▸ **Common or very common** Throat irritation

▸ **Rare or very rare** Wheezing

● **PRESCRIBING AND DISPENSING INFORMATION**

▸ When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160. The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name. Pressurised metered-doses inhalers with extra-fine particles (*Qvar®* and *Kelhale®*) are more potent than, and not interchangeable with, traditional CFC-containing and CFC-free inhalers (*Clenil Modulite®* and *Soprobec®*).

QVAR® PREPARATIONS When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar®* should be prescribed for 200–250 micrograms of beclometasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar®* should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of *Qvar®* should be adjusted according to response.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary *Clenil Modulite®* 50 micrograms/metered inhalation may be prescribed.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

F 173

Budesonide

08-Mar-2022

● **DRUG ACTION** Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

● **INDICATIONS AND DOSE**

Bronchopulmonary dysplasia with spontaneous respiration

▸ BY INHALATION OF NEBULISED SUSPENSION

▸ Neonate: 500 micrograms twice daily.

▸ Child 1–4 months: 500 micrograms twice daily

Bronchopulmonary dysplasia with spontaneous respiration (severe symptoms)

▸ BY INHALATION OF NEBULISED SUSPENSION

▸ Child 1–4 months (body-weight 2.5 kg and above): 1 mg twice daily

Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)

▸ BY INHALATION OF POWDER

▸ Child 6–11 years: 200–400 micrograms once daily, dose to be given in the evening

▸ Child 12–17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening

Prophylaxis of asthma

▸ BY INHALATION OF POWDER

▸ Child 6–11 years: 100–400 micrograms twice daily, dose to be adjusted as necessary

▸ Child 12–17 years: 100–800 micrograms twice daily, dose to be adjusted as necessary

▸ BY INHALATION OF NEBULISED SUSPENSION

▸ Child 6 months–11 years: 125–500 micrograms twice daily, adjusted according to response; maximum 2 mg per day

▸ Child 12–17 years: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day

POTENCY

▸ Dose adjustments may be required for some inhaler devices, see under individual preparations.

BUDELIN NOVOLIZER ®

Prophylaxis of asthma

- BY INHALATION OF POWDER
- Child 6–11 years: 200–400 micrograms twice daily, dose is adjusted as necessary
- Child 12–17 years: 200–800 micrograms twice daily, dose is adjusted as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose

- BY INHALATION OF POWDER
- Child 6–11 years: 200–400 micrograms once daily, to be taken in the evening
- Child 12–17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

PULMICORT ® RESPULES

Prophylaxis of asthma

- BY INHALATION OF NEBULISED SUSPENSION
- Child 3 months–11 years: Initially 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily
- Child 12–17 years: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

Croup

- BY INHALATION OF NEBULISED SUSPENSION
- Child: 2 mg for 1 dose, alternatively 1 mg for 2 doses separated by a 30 minute interval, dose may be repeated every 12 hours until clinical improvement

PULMICORT ® TURBOHALER

Prophylaxis of asthma

- BY INHALATION OF POWDER
- Child 5–11 years: 100–400 micrograms twice daily, dose to be adjusted as necessary
- Child 12–17 years: 100–800 micrograms twice daily, dose to be adjusted as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose

- BY INHALATION OF POWDER
- Child 5–11 years: 200–400 micrograms once daily, to be taken in the evening
- Child 12–17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

- **UNLICENSED USE** *Pulmicort® nebuliser solution* not licensed for use in children under 3 months; not licensed for use in bronchopulmonary dysplasia.
- **INTERACTIONS** → Appendix 1: corticosteroids
- **DIRECTIONS FOR ADMINISTRATION** Budesonide nebuliser suspension is not suitable for use in ultrasonic nebulisers.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer budesonide dry powder inhaler and nebuliser suspension.

Budesonide with formoterol

20-Apr-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, budesonide p. 174, formoterol fumarate p. 168.

- **INDICATIONS AND DOSE**

SYMBICORT 100/6 TURBOHALER ®

Asthma, maintenance therapy

- BY INHALATION OF POWDER
- Child 6–17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy

- BY INHALATION OF POWDER
- Child 12–17 years: Maintenance 2 puffs daily in 1–2 divided doses; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required, max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment is recommended

SYMBICORT 200/6 TURBOHALER ®

Asthma, maintenance therapy

- BY INHALATION OF POWDER
- Child 12–17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy

- BY INHALATION OF POWDER
- Child 12–17 years: Maintenance 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required, max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment is recommended

SYMBICORT 400/12 TURBOHALER ®

Asthma, maintenance therapy

- BY INHALATION OF POWDER
- Child 12–17 years: Initially 1 puff twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

continued →

SYMBICORT® 100/3 PRESSURISED INHALER

Asthma, maintenance therapy

- BY INHALATION OF AEROSOL
- Child 12–17 years: Initially 2–4 inhalations twice daily; reduced to 1 inhalation daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy

- BY INHALATION OF AEROSOL
- Child 12–17 years: Maintenance 4 inhalations daily in 1–2 divided doses, increased if necessary up to 4 inhalations twice daily; 2 inhalations as required for relief of symptoms, increased if necessary up to 12 inhalations as required, usual max. 16 inhalations per day; up to 24 inhalations daily can be used for a limited time but medical assessment is recommended

- **INTERACTIONS** → Appendix 1: beta$_2$ agonists • corticosteroids
- **PATIENT AND CARER ADVICE** Patient counselling is advised for budesonide with formoterol inhalation (administration).
- **NATIONAL FUNDING/ACCESS DECISIONS**

F 173

Fluticasone

08-Mar-2022

- **INDICATIONS AND DOSE**

Prophylaxis of asthma

- BY INHALATION OF POWDER
- Child 5–15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- Child 16–17 years: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- BY INHALATION OF AEROSOL
- Child 4–15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- Child 16–17 years: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- BY INHALATION OF NEBULISED SUSPENSION
- Child 4–15 years: 1 mg twice daily
- Child 16–17 years: 0.5–2 mg twice daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 159.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS**
- **Rare or very rare** Dyspepsia
- **DIRECTIONS FOR ADMINISTRATION** EvGr Fluticasone nebuliser liquid may be diluted with sterile sodium chloride 0.9%. It is not suitable for use in ultrasonic nebulisers. M
- **PRESCRIBING AND DISPENSING INFORMATION**
- When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer all fluticasone inhalation preparations.

Mometasone furoate

09-Mar-2022

● **INDICATIONS AND DOSE**

Prophylaxis of asthma

▸ BY INHALATION OF POWDER

▸ Child 12–17 years: Initially 400 micrograms daily in 1–2 divided doses, single dose to be inhaled in the evening, reduced to 200 micrograms once daily, if control maintained

Prophylaxis of severe asthma

▸ BY INHALATION OF POWDER

▸ Child 12–17 years: Increased if necessary up to 400 micrograms twice daily

● **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS**

▸ **Common or very common** Candida infection

● **PRESCRIBING AND DISPENSING INFORMATION**

▸ When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mometasone by inhaler. Medicines for Children leaflet: Mometasone furoate inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/medicines/mometasone-furoate-inhaler-for-asthma-prevention-prophylaxis/

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

▸ **Mometasone furoate (*Asmanex*® *Twisthaler*®) for asthma (November 2003)** SMC No. 79/03 Recommended with restrictions

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10

▸ **Asmanex Twisthaler** (Organon Pharma (UK) Ltd)

Mepolizumab

05-May-2021

- **DRUG ACTION** Mepolizumab is a humanised anti-interleukin-5 (anti-IL-5) monoclonal antibody; it reduces the production and survival of eosinophils.

- **INDICATIONS AND DOSE**

Add on treatment for severe refractory eosinophilic asthma (under expert supervision)

- BY SUBCUTANEOUS INJECTION
- Child 6–11 years: 40 mg every 4 weeks
- Child 12–17 years: 100 mg every 4 weeks

- **CAUTIONS** Helminth infection

CAUTIONS, FURTHER INFORMATION

- Helminth infections Manufacturer advises pre-existing helminth infections should be treated before initiation of therapy; if patients become infected during treatment and do not respond to anti-helminth treatment, consider treatment interruption.

- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain upper · administration related reaction · back pain · eczema · fever · headache · hypersensitivity · increased risk of infection · nasal congestion
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited data available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises injection is given into the thigh, abdomen, or upper arm. Patients may self-administer *Nucala*® pre-filled devices into the thigh or abdomen after appropriate training in preparation and administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Mepolizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to seek medical advice if their asthma remains uncontrolled or worsens after initiation of treatment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Mepolizumab (*Nucala*®) as add-on therapy for patients aged 6 years and older with severe refractory eosinophilic asthma (April 2019)** SMC No. SMC2139 Recommended with restrictions

All Wales Medicines Strategy Group (AWMSG) decisions

- **Mepolizumab (*Nucala*®) as add-on treatment for severe refractory eosinophilic asthma in patients aged 6 years and older (April 2019)** AWMSG No. 3750 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Edetic acid (edta), polysorbates

- **Nucala** (GlaxoSmithKline UK Ltd)

Mepolizumab 100 mg per 1 ml Nucala 100mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection PoM £840.00

Nucala 100mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £840.00

Powder for solution for injection

EXCIPIENTS: May contain Polysorbates

- **Nucala** (GlaxoSmithKline UK Ltd)

Mepolizumab 100 mg Nucala 100mg powder for solution for injection vials | 1 vial PoM £840.00 (Hospital only)

Omalizumab

17-May-2021

- **INDICATIONS AND DOSE**

Prophylaxis of severe persistent allergic asthma

- BY SUBCUTANEOUS INJECTION
- Child 6–17 years: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H_1 antihistamine treatment

- BY SUBCUTANEOUS INJECTION
- Child 12–17 years: 300 mg every 4 weeks

- **CAUTIONS** Autoimmune disease · susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic
- **SIDE-EFFECTS**
- **Common or very common** Fever · gastrointestinal discomfort · headache · skin reactions
- **Uncommon** Cough · diarrhoea · dizziness · drowsiness · fatigue · flushing · increased risk of infection · influenza like illness · limb swelling · nausea · paraesthesia · photosensitivity reaction · postural hypotension · respiratory disorders · syncope · weight increased
- **Rare or very rare** Angioedema · hypersensitivity · systemic lupus erythematosus (SLE)
- **Frequency not known** Alopecia · eosinophilic granulomatosis with polyangiitis · immune thrombocytopenic purpura · joint disorders · lymphadenopathy · myalgia

SIDE-EFFECTS, FURTHER INFORMATION **Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome)** Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.

Hypersensitivity reactions Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

- **PREGNANCY** Manufacturer advises avoid unless essential—crosses the placenta.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Omalizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.
- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

NICE decisions

- **Omalizumab for severe persistent allergic asthma (April 2013)** NICE TA278 Recommended
- **Omalizumab for previously treated chronic spontaneous urticaria (June 2015)** NICE TA339 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- **Omalizumab (*Xolair*®) as add-on therapy for the treatment of chronic spontaneous urticaria in adult and adolescent (12 years and above) patients with inadequate response to H_1-antihistamine treatment (January 2015)** SMC No. 1017/14 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Xolair** (Novartis Pharmaceuticals UK Ltd)
  Omalizumab 150 mg per 1 ml Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £256.15 DT = £256.15
  Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £128.07 DT = £128.07

LEUKOTRIENE RECEPTOR ANTAGONISTS

Montelukast

10-Nov-2021

- **INDICATIONS AND DOSE**

Prophylaxis of asthma

- BY MOUTH
- Child 6 months–5 years: 4 mg once daily, dose to be taken in the evening
- Child 6–14 years: 5 mg once daily, dose to be taken in the evening
- Child 15–17 years: 10 mg once daily, dose to be taken in the evening

Symptomatic relief of seasonal allergic rhinitis in patients with asthma

- BY MOUTH
- Child 15–17 years: 10 mg once daily, dose to be taken in the evening

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MONTELUKAST (*SINGULAIR*®): REMINDER OF THE RISK OF NEUROPSYCHIATRIC REACTIONS (SEPTEMBER 2019)
Healthcare professionals are advised to be alert for neuropsychiatric reactions, including speech impairment and obsessive-compulsive symptoms, in adults, adolescents, and children taking montelukast. The risks and benefits of continuing treatment should be evaluated if these reactions occur. Patients should be advised to read the list of neuropsychiatric reactions in the information leaflet and seek immediate medical attention if they occur.

- **INTERACTIONS** → Appendix 1: montelukast
- **SIDE-EFFECTS**

- **Common or very common** Diarrhoea · fever · gastrointestinal discomfort · headache · nausea · skin reactions · upper respiratory tract infection · vomiting
- **Uncommon** Akathisia · anxiety · arthralgia · asthenia · behaviour abnormal · depression · dizziness · drowsiness · dry mouth · haemorrhage · irritability · malaise · muscle complaints · oedema · seizure · sensation abnormal · sleep disorders
- **Rare or very rare** Angioedema · concentration impaired · disorientation · eosinophilic granulomatosis with polyangiitis · erythema nodosum · hallucination · hepatic disorders · memory loss · palpitations · psychiatric disorders · pulmonary eosinophilia · speech disorder · suicidal behaviours · tremor

SIDE-EFFECTS, FURTHER INFORMATION Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- **PREGNANCY** Manufacturer advises avoid unless essential. There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.
- **BREAST FEEDING** Manufacturer advises avoid unless essential.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION**
- When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.
  Flavours of chewable tablet formulations may include cherry.
- **PATIENT AND CARER ADVICE**
  Administration Patients or carers should be given advice on how to administer montelukast granules.
  Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in speech or behaviour occur—see also *Important safety information*.
  Medicines for Children leaflet: Montelukast for asthma www.medicinesforchildren.org.uk/medicines/montelukast-for-asthma/
- **NATIONAL FUNDING/ACCESS DECISIONS**

SINGULAIR® GRANULES For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Montelukast (*Singulair*® *Paediatric*) for asthma in children aged 2–14 years** SMC No. 383/07 Recommended with restrictions

SINGULAIR® CHEWABLE TABLETS For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Montelukast (*Singulair*® *Paediatric*) chewable tablets for asthma in children aged 2–14 years (July 2007)** SMC No. 383/07 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Granules

- **Montelukast (Non-proprietary)**
  Montelukast (as Montelukast sodium) 4 mg Montelukast 4mg granules sachets sugar free sugar-free | 28 sachet PoM £19.99 DT = £3.53

MAST-CELL STABILISERS

Sodium cromoglicate

27-Sep-2021

(Sodium cromoglycate)

- **INDICATIONS AND DOSE**

Prophylaxis of asthma

- BY INHALATION OF AEROSOL
- Child 5–17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff

Food allergy (in conjunction with dietary restriction)

- BY MOUTH
- Child 2–13 years: Initially 100 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- Child 14–17 years: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

- When used by inhalation

See Respiratory system, drug delivery p. 159.

- **CAUTIONS**
- When used by inhalation Discontinue if eosinophilic pneumonia occurs
- **SIDE-EFFECTS**
- When used by inhalation Cough · headache · pneumonia eosinophilic · rhinitis · throat irritation
- With oral use Arthralgia · nausea · rash

SIDE-EFFECTS, FURTHER INFORMATION When used by inhalation, if paradoxical bronchospasm occurs, a short-acting beta$_2$-agonist should be used to control symptoms; treatment with sodium cromoglicate should be discontinued.

- **PREGNANCY** Not known to be harmful.
- When used by inhalation Can be taken as normal during pregnancy.
- **BREAST FEEDING** Unlikely to be present in milk.
- When used by inhalation Can be taken as normal during breast-feeding.
- **TREATMENT CESSATION**
- When used by inhalation Withdrawal of sodium cromoglicate should be done gradually over a period of one week—symptoms of asthma may recur.
- **DIRECTIONS FOR ADMINISTRATION**
- With oral use Expert sources advise capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking.
- **PRESCRIBING AND DISPENSING INFORMATION**
- When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160.
- **PATIENT AND CARER ADVICE**
- With oral use Patient counselling is advised for sodium cromoglicate capsules (administration).
- When used by inhalation Patient counselling is advised for sodium cromoglicate pressurised inhalation (administration).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

- **Sodium cromoglicate (Non-proprietary)**
  Sodium cromoglicate 20 mg per 1 mg Sodium cromoglicate 100mg/5ml oral solution 5ml unit dose ampoules sugar free sugar-free | 96 unit dose PoM £121.86 DT = £121.86

Capsule

CAUTIONARY AND ADVISORY LABELS 22

- **Sodium cromoglicate (Non-proprietary)**
  Sodium cromoglicate 100 mg Sodium cromoglicate 100mg capsules | 100 capsule PoM £105.24 DT = £53.24
- **Nalcrom** (Sanofi)
  Sodium cromoglicate 100 mg Nalcrom 100mg capsules | 100 capsule PoM £41.14 DT = £53.24

XANTHINES

Aminophylline

05-May-2021

- **INDICATIONS AND DOSE**

Severe acute asthma in patients not previously treated with theophylline

- BY SLOW INTRAVENOUS INJECTION
- Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion

Severe acute asthma

- BY INTRAVENOUS INFUSION
- Child 1 month–11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration
- Child 12–17 years: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Chronic asthma

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose adjustment may be necessary if smoking started or stopped during treatment.

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

PHARMACOKINETICS

- Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.
- Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

- **UNLICENSED USE** Aminophylline injection not licensed for use in children under 6 months.
- **CAUTIONS** Arrhythmias following rapid intravenous injection · cardiac arrhythmias or other cardiac disease · epilepsy · fever · hypertension · peptic ulcer · risk of hypokalaemia · thyroid disorder

● **INTERACTIONS** → Appendix 1: aminophylline

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Headache · nausea · palpitations · seizure (more common when given too rapidly by intravenous injection)

SPECIFIC SIDE-EFFECTS

▸ With intravenous use Abdominal pain · anxiety · arrhythmia (more common when given too rapidly by intravenous injection) · confusion · delirium · diarrhoea · dizziness · electrolyte imbalance · gastrointestinal haemorrhage · gastrooesophageal reflux disease · hyperthermia · hyperventilation · hypotension (more common when given too rapidly by intravenous injection) · insomnia · mania · metabolic disorder · pain · skin reactions · tachycardia (more common when given too rapidly by intravenous injection) · thirst · tremor · vertigo · visual impairment · vomiting

▸ With oral use Arrhythmias · central nervous system stimulation · epigastric discomfort

SIDE-EFFECTS, FURTHER INFORMATION Potentially serious hypokalaemia may result from beta$_2$-agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For specific details on the management of poisoning, see *Theophylline*, under Emergency treatment of poisoning p. 944.

● **ALLERGY AND CROSS-SENSITIVITY** Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.

● **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

● **BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of reduced clearance).

Dose adjustments ▸ With oral use Manufacturer advises consider dose reduction.

▸ With intravenous use Manufacturer advises maintenance dose reduction—consult product literature.

● **MONITORING REQUIREMENTS**

▸ Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.

▸ Measurement of plasma-theophylline concentration may be helpful and is **essential** if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.

▸ In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

▸ If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.

▸ With oral use Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

● **DIRECTIONS FOR ADMINISTRATION**

▸ With intravenous use For *intravenous injection*, manufacturer advises give **very slowly** over at least 20 minutes (with close monitoring). For *intravenous infusion*, expert sources advise dilute to a concentration of 1 mg/mL with Glucose 5% *or* Sodium Chloride 0.9%.

● **PRESCRIBING AND DISPENSING INFORMATION**

▸ When used for Asthma For choice of therapy, see Asthma, acute p. 164 and Asthma, chronic p. 160. Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

Modified release The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

▸ **Aminophylline (Non-proprietary)**

Aminophylline 25 mg per 1 ml Aminophylline 250mg/10ml solution for injection ampoules | 10 ampoule PoM £12.00 DT = £12.00

Theophylline

05-May-2021

● **INDICATIONS AND DOSE**

UNIPHYLLIN CONTINUS ®

Chronic asthma

▸ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▸ Child 2-11 years: 9 mg/kg every 12 hours (max. per dose 200 mg), dose may be increased in some children with chronic asthma; increased to 10–16 mg/kg every 12 hours (max. per dose 400 mg), may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

▸ Child 12-17 years: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

Nebuliser solutions

- **HYPERTONIC SODIUM CHLORIDE SOLUTIONS**

MUCOCLEAR® 3%

- **INDICATIONS AND DOSE**

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) | Mild to moderate acute viral bronchiolitis in infants

- BY INHALATION OF NEBULISED SOLUTION
- Child: 4 mL 2–4 times a day, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

MucoClear 3% inhalation solution 4ml ampoules (Pari Medical Ltd) **Sodium chloride 30 mg per 1 ml** 20 ampoule · NHS indicative price = £12.98 · Drug Tariff (Part IXa)60 ampoule · NHS indicative price = £27.00 · Drug Tariff (Part IXa)

MUCOCLEAR® 6%

- **INDICATIONS AND DOSE**

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)

- BY INHALATION OF NEBULISED SOLUTION
- Child: 4 mL twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

MucoClear 6% inhalation solution 4ml ampoules (Pari Medical Ltd) **Sodium chloride 60 mg per 1 ml** 20 ampoule · NHS indicative price = £12.98 · Drug Tariff (Part IXa)60 ampoule · NHS indicative price = £27.00 · Drug Tariff (Part IXa)

NEBUSAL®

- **INDICATIONS AND DOSE**

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)

- BY INHALATION OF NEBULISED SOLUTION
- Child: 4 mL up to twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

Nebusal 7% inhalation solution 4ml vials (Accord Healthcare Ltd) **Sodium chloride 70 mg per 1 ml** 60 vial · NHS indicative price = £27.00 · Drug Tariff (Part IXa)

PULMOCLEAR ®

● INDICATIONS AND DOSE

Mobilise lower respiratory tract secretions and prevent drying of bronchial mucous.

► BY INHALATION OF NEBULISED SOLUTION

‣ Child: (consult product literature)

PulmoClear 6% inhalation solution 4ml vials (TriOn Pharma Ltd) 60 vial • NHS indicative price = £16.59 • Drug Tariff (Part IXa)

PulmoClear 3% inhalation solution 4ml vials (TriOn Pharma Ltd) **Sodium chloride 30 mg per 1 ml** 60 vial • NHS indicative price = £16.47 • Drug Tariff (Part IXa)

PulmoClear 7% inhalation solution 4ml vials (TriOn Pharma Ltd) **Sodium chloride 70 mg per 1 ml** 60 vial • NHS indicative price = £16.80 • Drug Tariff (Part IXa)

RESP-EASE ®

● INDICATIONS AND DOSE

Mobilise lower respiratory tract secretions and prevent drying of bronchial mucous.

For use with all pressurised (aerosol) inhalers.

OptiChamber (Respironics (UK) Ltd)
1 device • NHS indicative price = £4.28 • Drug Tariff (Part IXa)

OPTICHAMBER ® **DIAMOND**
For use with all pressurised (aerosol) inhalers.

OptiChamber Diamond (Respironics (UK) Ltd)
1 device • NHS indicative price = £4.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with large LiteTouch mask 5 years-adult (Respironics (UK) Ltd)
1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with medium LiteTouch mask 1-5 years (Respironics (UK) Ltd)
1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with small LiteTouch mask 0-18 months (Respironics (UK) Ltd)
1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

POCKET CHAMBER ®
Small volume device. For use with all pressurised (aerosol) inhalers.

Pocket Chamber (nSpire Health Ltd)
1 device • NHS indicative price = £4.18 • Drug Tariff (Part IXa)

Pocket Chamber with adult mask (nSpire Health Ltd)
1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with child mask (nSpire Health Ltd)
1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with infant mask (nSpire Health Ltd)
1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with teenager mask (nSpire Health Ltd)
1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

SPACE CHAMBER PLUS ®
For use with all pressurised (aerosol) inhalers.

Space Chamber Plus (Medical Developments International Ltd)
1 device • NHS indicative price = £4.26 • Drug Tariff (Part IXa)

Space Chamber Plus with large mask (Medical Developments International Ltd)
1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

Space Chamber Plus with medium mask (Medical Developments International Ltd)
1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

Space Chamber Plus with small mask (Medical Developments International Ltd)
1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

VOLUMATIC ®
Large-volume device. For use with *Clenil Modulite*®, *Flixotide*®, *Seretide*®, *Serevent*®, and *Ventolin*® inhalers.

Volumatic (GlaxoSmithKline UK Ltd)
1 device • NHS indicative price = £3.88 • Drug Tariff (Part IXa)

Volumatic with paediatric mask (GlaxoSmithKline UK Ltd)
1 device • NHS indicative price = £6.83 • Drug Tariff (Part IXa)

VORTEX ®
Medium-volume device. For use with all pressurised (aerosol) inhalers.

2 Allergic conditions

Antihistamines, allergen immunotherapy and allergic emergencies

15-Nov-2021

Antihistamines

Antihistamines (histamine H_1-receptor antagonists) are classified as *sedating* or *non-sedating*, according to their relative potential for CNS depression. Antihistamines differ in their duration of action, incidence of drowsiness, and antimuscarinic effects; the response to an antihistamine may vary from child to child. Either a sedating or a non-sedating antihistamine may be used to treat an acute allergic reaction; for conditions with more persistent symptoms which require regular treatment, a non-sedating antihistamine should be used to minimise the risk of sedation and psychomotor impairment associated with sedating antihistamines.

Oral antihistamines are used in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hay fever), and may be of some value in vasomotor rhinitis; rhinorrhoea and sneezing is reduced, but antihistamines are usually less effective for nasal congestion. Antihistamines are used topically to treat allergic reactions in the eye and in the nose. Topical application of antihistamines to the skin is not recommended.

An oral antihistamine may be used to prevent urticaria, and for the treatment of acute urticarial rashes, pruritus, insect bites, and stings.

Antihistamines are also used in the management of nausea and vomiting, and migraine. In addition, antihistamines may be given in anaphylaxis following initial stabilisation of the child, especially in children with persistent cutaneous symptoms—for further information, see *Anaphylaxis*.

The *non-sedating* antihistamine cetirizine hydrochloride p. 189 is safe and effective in children. Other non-sedating antihistamines that are used include acrivastine p. 188, bilastine p. 189, desloratadine p. 189 (an active metabolite of loratadine p. 191), fexofenadine hydrochloride p. 190 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 190 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine p. 191. Most non-sedating antihistamines are long-acting (usually 12–24 hours). There is little evidence that desloratadine or levocetirizine hydrochloride confer any additional benefit—they should be reserved for children who cannot tolerate other therapies.

Sedating antihistamines are occasionally useful when insomnia is associated with urticaria and pruritus. Most of the sedating antihistamines are relatively short-acting, but promethazine may be effective for up to 12 hours. Alimemazine tartrate p. 192 and **promethazine** have a more sedative effect than chlorphenamine maleate p. 193 and cyclizine p. 290.

Allergen immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or grass pollen extract p. 197 and tree pollen extract p. 198 can improve symptoms of asthma and allergic rhinoconjunctivitis in children. Vaccines containing bee venom extract p. 196 or wasp venom extract p. 198 may be used to reduce the risk of severe anaphylaxis and systemic reactions in children with hypersensitivity to wasp and bee stings. An oral preparation

of grass pollen extract p. 197 is licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis, and an oral preparation of house dust mite extract p. 197 is licensed for disease-modifying treatment of house dust mite allergic rhinitis in certain children. Children requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 180 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is licensed for use as additional therapy in children over 6 years with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroid together with a long-acting beta$_2$ agonist. Omalizumab should be initiated by physicians experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H_1 antihistamine treatment.

Anaphylaxis and allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by rapidly developing airway and/or breathing and/or circulation problems, and is usually associated with skin and mucosal changes; prompt treatment is required.

The most common allergens that cause anaphylaxis include food (e.g. peanuts, sesame, soy, tree nuts, shellfish, and cow's milk—see Food allergy p. 55), drugs (e.g. antibacterials, aspirin and other NSAIDs, neuromuscular blocking drugs, chlorhexidine, contrast media, and vaccines), venom (e.g. insect stings), and latex. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

Certain children may be at higher risk of anaphylaxis, either because of an existing comorbidity (such as asthma) or because of an increased likelihood of repeated exposure to the same allergen (such as those with venom or food allergies).

Recommendations on the management of anaphylaxis reflect the *Resuscitation Council (UK)—Emergency treatment of anaphylaxis: Guidelines for healthcare providers (May* 2021*)* and *NICE—Anaphylaxis: assessment and referral after emergency treatment guidelines (CG*134*, updated August* 2020*)*.

Initial treatment of anaphylaxis

Cardiopulmonary arrest may follow an anaphylactic reaction—start cardiopulmonary resuscitation (CPR) immediately. For guidance on CPR, see Life support algorithm (image) inside back cover.

EvGr Immediately call for an ambulance or the resuscitation team and begin initial treatment for anaphylaxis.

Remove the trigger causing the anaphylactic reaction (e.g. stopping the suspected drug or removing the stinger after an insect sting). Place the child in a comfortable position taking into account their presenting signs and symptoms—lay the child flat (with or without legs raised) to aid in the restoration of blood pressure, or in a semi-recumbent position for children with airway and breathing problems (and no evidence of cardiovascular instability) to make breathing easier, or in the recovery position for unconscious children who are breathing normally; pregnant females should lie on their left side to prevent aortocaval compression.

Intramuscular adrenaline/epinephrine p. 149 should be given as first line treatment for anaphylaxis. If there is doubt about the diagnosis, give intramuscular adrenaline/epinephrine and seek expert advice. Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions. Assess response to treatment by monitoring vital signs (such as blood pressure, pulse, respiratory function, and level of consciousness) and auscultate for wheeze.

A repeat dose of intramuscular adrenaline/epinephrine should be given after a 5-minute interval if there is no improvement in the child's condition. Children who have no improvement in respiratory and/or cardiovascular problems despite 2 appropriate doses of intramuscular adrenaline/epinephrine, should have their care escalated quickly and managed as having refractory anaphylaxis. A For further information, see *Refractory anaphylaxis*.

EvGr Nebulised adrenaline/epinephrine may be effective as an adjunct to treat upper airways obstruction caused by laryngeal oedema, but only after treatment with intramuscular adrenaline/epinephrine and not as an alternative.

High-flow oxygen should be given as soon as it is available.

Intravenous fluids should be given to children with hypotension/shock, or if there is poor response to an initial dose of adrenaline/epinephrine.

Antihistamines are not recommended as part of the initial emergency treatment of anaphylaxis. Following stabilisation of the child, a non-sedating oral antihistamine such as cetirizine hydrochloride p. 189 (in preference to chlorphenamine maleate) may be considered, especially in children with persistent cutaneous symptoms (urticaria and/or angioedema). If oral administration is not possible, intramuscular or intravenous chlorphenamine maleate p. 193 can be given.

The routine use of corticosteroids for the emergency treatment of anaphylaxis is not recommended. Consider corticosteroids after initial resuscitation for refractory reactions or ongoing asthma/shock; corticosteroids must not be given preferentially to adrenaline/epinephrine p. 149. Corticosteroids should be given via the oral route where possible.

Inhaled bronchodilator therapy with salbutamol p. 170 and/or ipratropium bromide p. 167 may also be considered for children with persisting respiratory problems, but should not be used as an alternative to further treatment with adrenaline/epinephrine. A For guidance on the management of bronchospasm in severe asthma, see Asthma, acute p. 164.

For further guidance on the initial management of anaphylaxis, see Resuscitation Council (UK) guideline: **Emergency treatment of anaphylaxis** (available at: www.resus.org.uk/library/additional-guidance/guidance-anaphylaxis/emergency-treatment).

Refractory anaphylaxis

Refractory anaphylaxis is defined as anaphylaxis that requires ongoing treatment due to persisting respiratory and/or cardiovascular problems despite 2 appropriate doses of intramuscular adrenaline/epinephrine— EvGr seek early critical care support.

Children should be treated with an intravenous adrenaline/epinephrine infusion. Intravenous adrenaline/epinephrine should only be given by experienced specialists and in a setting where children can be carefully monitored. If an intravenous infusion cannot be administered safely (e.g. due to a child being outside a hospital setting), continue to give intramuscular adrenaline/epinephrine at 5-minute intervals while life-threatening cardiovascular and/or respiratory features persist. Adrenaline/epinephrine therapy should be supported with intravenous fluid therapy. A For further guidance on intravenous adrenaline/epinephrine and other treatment options in refractory anaphylaxis (such as nebulised adrenaline/epinephrine, bronchodilators,

vasopressors, corticosteroids, and glucagon (for children on beta-blockers)), see Resuscitation Council (UK) guideline: **Emergency treatment of anaphylaxis** (available at: www.resus.org.uk/library/additional-guidance/guidance-anaphylaxis/emergency-treatment).

Discharge and follow-up

EvGr Prior to discharge from hospital, children (or their family or carers) should be provided with 2 adrenaline/epinephrine auto-injectors, trained on their correct use, and advised to carry these with them at all times. The provision of adrenaline/epinephrine auto-injectors are appropriate for all children who have had anaphylaxis, with the exception of those with a drug-induced reaction (unless future exposure to the trigger drug will be difficult to avoid). Children who are provided with auto-injectors should have appropriate follow-up including contact with their general practitioner.

Children and their family or carers should also be provided with information about anaphylaxis, the risk of a biphasic reaction (with clear instructions to return to hospital if symptoms return), avoidance of suspected triggers, and what to do if an anaphylactic reaction occurs. An emergency management or action plan should be provided, and referral to a specialist allergy clinic made. A

Angioedema

Allergic angioedema

Angioedema can be caused by an allergic reaction. It involves the swelling of deeper tissues, most commonly in the eyelids and lips, and sometimes the tongue and throat. Allergic angioedema that occurs with life-threatening airway and/or breathing and/or circulatory problems should be managed as **anaphylaxis**. For further guidance, see *Anaphylaxis*.

Hereditary angioedema

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks (including attacks involving laryngeal oedema) as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 198 (in fresh frozen plasma or in partially purified form) can terminate acute attacks of *hereditary angioedema*; it can also be used for short-term prophylaxis before dental, medical, or surgical procedures. Tranexamic acid p. 88 is used for short-term or long-term prophylaxis of hereditary angioedema; short-term prophylaxis is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards. Danazol [unlicensed indication] is best avoided in children because of its androgenic effects, but it can be used for short-term prophylaxis of hereditary angioedema.

Lanadelumab p. 200 or berotralstat p. 200 may be an option for the prevention of recurrent attacks of hereditary angioedema. For guidance on their use, see NICE pathway: **Immune system conditions** (available at: pathways.nice.org.uk/pathways/blood-and-immune-system-conditions).

Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

Age	Dose	Volume of adrenaline
▸ Child up to 6 months	100–150 micrograms	0.1–0.15 mL 1 in 1000 (1 mg/mL) adrenaline[1]
▸ Child 6 months–5 years	150 micrograms	0.15 mL 1 in 1000 (1 mg/mL) adrenaline[2]
▸ Child 6–11 years	300 micrograms	0.3 mL 1 in 1000 (1 mg/mL) adrenaline
▸ Child 12–17 years	500 micrograms	0.5 mL 1 in 1000 (1 mg/mL) adrenaline[3]

Repeat dose after 5 minutes if no response. If life-threatening features persist, further doses can be given every 5 minutes until specialist critical care available.

1. Use suitable syringe for measuring small volume
2. Use suitable syringe for measuring small volume
3. 300 micrograms (0.3 mL) if child is small or prepubertal

ANTIHISTAMINES › NON-SEDATING

Acrivastine

23-Apr-2021

● **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria

▸ BY MOUTH

▸ Child 12–17 years: 8 mg 3 times a day

● **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 688

● **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● **SIDE-EFFECTS**

▸ **Common or very common** Drowsiness · dry mouth

▸ **Frequency not known** Dizziness · rash

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

● **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated if history of hypersensitivity to triprolidine. M

● **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

● **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● **RENAL IMPAIRMENT** EvGr Avoid in severe impairment. M

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients and their carers should be advised that drowsiness can occur and may affect performance of skilled tasks (e.g. cycling or driving).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

▸ **Acrivastine (Non-proprietary)**
Acrivastine 8 mg Acrivastine 8mg capsules | 24 capsule P £4.45–£6.40

▸ **Benadryl Allergy Relief** (McNeil Products Ltd)
Acrivastine 8 mg Benadryl Allergy Relief 8mg capsules | 24 capsule P £5.45 | 48 capsule P £9.91

Bilastine

14-Dec-2020

● **INDICATIONS AND DOSE**

Symptomatic relief of allergic rhinoconjunctivitis and urticaria

▸ BY MOUTH

▸ Child 12–17 years: 20 mg once daily

● **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 688

● **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● **SIDE-EFFECTS**

▸ **Common or very common** Drowsiness · headache

▸ **Uncommon** Anxiety · appetite increased · asthenia · bundle branch block · diarrhoea · dry mouth · dyspnoea · fever · gastritis · gastrointestinal discomfort · insomnia · nasal complaints · nausea · oral herpes · pre-existing condition improved · pruritus · QT interval prolongation · sinus arrhythmia · thirst · tinnitus · vertigo · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

● **PREGNANCY** Avoid—limited information available. Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

● **BREAST FEEDING** Avoid—no information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablet should be taken 1 hour before or 2 hours after food or fruit juice.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer bilastine tablets.

Driving and skilled tasks Patients and their carers should be advised that drowsiness can occur and may affect performance of skilled tasks (e.g. cycling or driving).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23

▸ **Ilaxten** (A. Menarini Farmaceutica Internazionale SRL)

Bilastine 20 mg Ilaxten 20mg tablets | 30 tablet PoM £6.00 DT = £6.00

Cetirizine hydrochloride

10-Nov-2021

● **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria, atopic dermatitis

▸ BY MOUTH

▸ Child 1 year: 250 micrograms/kg twice daily

▸ Child 2–5 years: 2.5 mg twice daily

▸ Child 6–11 years: 5 mg twice daily

▸ Child 12–17 years: 10 mg once daily

● **UNLICENSED USE** Not licensed for use in children under 2 years.

● **CAUTIONS** Epilepsy

● **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● **SIDE-EFFECTS**

▸ **Uncommon** Agitation · asthenia · diarrhoea · malaise · paraesthesia · skin reactions

▸ **Rare or very rare** Aggression · angioedema · confusion · depression · hallucination · hepatic function abnormal · insomnia · movement disorders · oculogyration · oedema · seizure · syncope · tachycardia · taste altered · thrombocytopenia · tic · tremor · urinary disorders · vision disorders · weight increased

▸ **Frequency not known** Abdominal pain · appetite increased · dizziness · drowsiness · dry mouth · headache · memory loss · nausea · pharyngitis · suicidal ideation · vertigo

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as certirizine hydrochloride cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

● **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

● **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m^2.

Dose adjustments Use half normal dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m^2.

Use half normal dose and reduce dose frequency to alternate days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m^2.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Cetirizine for hayfever www.medicinesforchildren.org.uk/medicines/cetirizine-for-hayfever/

Driving and skilled tasks Patients and their carers should be advised that drowsiness can occur and may affect performance of skilled tasks (e.g. cycling or driving).

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Cetirizine Tablets 10 mg may be prescribed.

Cetirizine Oral Solution 5 mg/5 mL may be prescribed.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol

▸ **Cetirizine hydrochloride (Non-proprietary)**

Cetirizine hydrochloride 1 mg per 1 ml Cetirizine 1mg/ml oral solution sugar free sugar-free | 200 ml PoM £17.50 DT = £17.50

Tablet

▸ **Cetirizine hydrochloride (Non-proprietary)**

Cetirizine hydrochloride 10 mg Cetirizine 10mg tablets | 30 tablet PoM £0.79–£0.82 DT = £0.79

Capsule

▸ **Benadryl Allergy** (McNeil Products Ltd)

Cetirizine hydrochloride 10 mg Benadryl Allergy Liquid Release 10mg capsules | 7 capsule GSL £3.09 DT = £3.09

Desloratadine

23-Apr-2021

● **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as allergic rhinitis, urticaria, chronic idiopathic urticaria

▸ BY MOUTH

▸ Child 1–5 years: 1.25 mg once daily

▸ Child 6–11 years: 2.5 mg once daily

▸ Child 12–17 years: 5 mg once daily

PHARMACOKINETICS

▸ Desloratadine is a metabolite of loratadine.

● **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

- **SIDE-EFFECTS**
  - **Common or very common** Asthenia · dry mouth · headache
  - **Rare or very rare** Akathisia · arrhythmias · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · hallucination · hepatic disorders · insomnia · myalgia · nausea · palpitations · seizure · vomiting
  - **Frequency not known** Behaviour abnormal · photosensitivity reaction · QT interval prolongation

  SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as desloratadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated if history of hypersensitivity to loratadine. Ⓜ
- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **RENAL IMPAIRMENT** EvGr Use with caution in severe impairment. Ⓜ
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubblegum.
- **PATIENT AND CARER ADVICE**

  Driving and skilled tasks Patients and their carers should be advised that drowsiness can occur and may affect performance of skilled tasks (e.g. cycling or driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol, sorbitol

- **Desloratadine (Non-proprietary)**

  Desloratadine 500 microgram per 1 ml Desloratadine 2.5mg/5ml oral solution sugar free sugar-free | 100 ml PoM £7.57 sugar-free | 150 ml PoM £8.12–£16.46 DT = £12.63
- **Neoclarityn** (Organon Pharma (UK) Ltd)

  Desloratadine 500 microgram per 1 ml Neoclarityn 2.5mg/5ml oral solution sugar-free | 100 ml PoM £6.77 sugar-free | 150 ml PoM £10.15 DT = £12.63

Tablet

- **Desloratadine (Non-proprietary)**

  Desloratadine 5 mg Desloratadine 5mg tablets | 30 tablet PoM £6.77 DT = £1.59
- **Neoclarityn** (Organon Pharma (UK) Ltd)

  Desloratadine 5 mg Neoclarityn 5mg tablets | 30 tablet PoM £6.77 DT = £1.59

Fexofenadine hydrochloride

14-Dec-2020

- **INDICATIONS AND DOSE**

Symptomatic relief of seasonal allergic rhinitis

- BY MOUTH
  - Child 6–11 years: 30 mg twice daily
  - Child 12–17 years: 120 mg once daily

Symptomatic relief of chronic idiopathic urticaria

- BY MOUTH
  - Child 12–17 years: 180 mg once daily

PHARMACOKINETICS

- Fexofenadine is a metabolite of terfenadine.

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating
- **SIDE-EFFECTS**
  - **Common or very common** Dizziness · drowsiness · headache · nausea
  - **Uncommon** Fatigue
  - **Frequency not known** Diarrhoea · nervousness · palpitations · skin reactions · sleep disorders · tachycardia

  SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as fexofenadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.
- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **PATIENT AND CARER ADVICE**

  Driving and skilled tasks Patients and their carers should be advised that drowsiness can occur and may affect performance of skilled tasks (e.g. cycling or driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 5

- **Fexofenadine hydrochloride (Non-proprietary)**

  Fexofenadine hydrochloride 120 mg Fexofenadine 120mg tablets | 30 tablet PoM £6.23 DT = £1.54

  Fexofenadine hydrochloride 180 mg Telfast 180mg tablets | 30 tablet PoM £7.58 DT = £1.98

Levocetirizine hydrochloride

14-Dec-2020

- **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, urticaria

- BY MOUTH
  - Child 2–5 years: 1.25 mg twice daily
  - Child 6–17 years: 5 mg once daily

PHARMACOKINETICS

- Levocetirizine is an isomer of cetirizine.

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 688
- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating
- **SIDE-EFFECTS**
  - **Common or very common** Asthenia · constipation · diarrhoea · drowsiness · dry mouth · sleep disorders
  - **Uncommon** Abdominal pain
  - **Frequency not known** Aggression · agitation · angioedema · appetite increased · arthralgia · depression · dizziness · dyspnoea · hallucination · hepatitis · myalgia · nausea · oedema · palpitations · paraesthesia · seizure · skin reactions · suicidal ideation · syncope · tachycardia · taste altered · tremor · urinary disorders · vertigo · vision disorders · vomiting · weight increased

  SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as levocetirizine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m^2.
  Dose adjustments Reduce dose frequency to alternate days if estimated glomerular filtration rate 30–50 mL/minute/1.73 m^2.
  Reduce dose frequency to every 3 days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m^2.
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Patients and their carers should be advised that drowsiness can occur and may affect performance of skilled tasks (e.g. cycling or driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- **Xyzal** (UCB Pharma Ltd)
  Levocetirizine dihydrochloride 500 microgram per 1 ml Xyzal 0.5mg/ml oral solution sugar-free | 200 ml PoM £6.00 DT = £6.00

Tablet

- **Levocetirizine hydrochloride (Non-proprietary)**
  Levocetirizine dihydrochloride 5 mg Levocetirizine 5mg tablets | 30 tablet PoM £4.39 DT = £4.37
- **Xyzal** (UCB Pharma Ltd)
  Levocetirizine dihydrochloride 5 mg Xyzal 5mg tablets | 30 tablet PoM £4.39 DT = £4.37

Loratadine

10-Nov-2021

- **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

- BY MOUTH
- Child 2–11 years (body-weight up to 31 kg): 5 mg once daily
- Child 2–11 years (body-weight 31 kg and above): 10 mg once daily
- Child 12–17 years: 10 mg once daily

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating
- **SIDE-EFFECTS**
- **Common or very common** Drowsiness · fatigue · headache · nervousness
- **Uncommon** Appetite increased · insomnia
- **Rare or very rare** Alopecia · angioedema · dizziness · dry mouth · gastritis · hepatic function abnormal · nausea · palpitations · rash · seizure · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure).
  Dose adjustments Manufacturer advises initial dose reduction to alternate days in severe impairment.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Loratadine for allergy symptoms www.medicinesforchildren.org.uk/medicines/loratadine-for-allergy-symptoms/
  Driving and skilled tasks Patients and their carers should be advised that drowsiness can occur and may affect performance of skilled tasks (e.g. cycling or driving).
- **PROFESSION SPECIFIC INFORMATION**
  Dental practitioners' formulary Loratadine 10 mg tablets may be prescribed.
  Loratadine syrup 5 mg/5 mL may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol

- **Loratadine (Non-proprietary)**
  Loratadine 1 mg per 1 ml Loratadine 5mg/5ml oral solution | 100 ml PoM £5.15 DT = £4.89

Tablet

- **Loratadine (Non-proprietary)**
  Loratadine 10 mg Loratadine 10mg tablets | 30 tablet PoM DT = £0.86

Mizolastine

14-Dec-2020

- **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, urticaria

- BY MOUTH
- Child 12–17 years: 10 mg once daily

- **CONTRA-INDICATIONS** Cardiac disease · susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating
- **SIDE-EFFECTS**
- **Common or very common** Appetite increased · asthenia · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · headache · nausea · weight increased
- **Uncommon** Anxiety · arrhythmias · arthralgia · depression · myalgia · palpitations
- **Rare or very rare** Hypersensitivity
- **Frequency not known** Asthma exacerbated · bronchospasm · QT interval prolongation

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as mizolastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in significant impairment.
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Patients and their carers should be advised that drowsiness can occur and may affect performance of skilled tasks (e.g. cycling or driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

- **Mizollen** (Sanofi)

Mizolastine 10 mg Mizollen 10mg modified-release tablets | 30 tablet PoM £6.92 DT = £6.92

Rupatadine

29-Apr-2019

- **DRUG ACTION** Rupatadine is a second generation non-sedating antihistamine.

- **INDICATIONS AND DOSE**

Symptomatic relief of allergic rhinitis and urticaria

- BY MOUTH USING TABLETS
- Child 12–17 years: 10 mg once daily
- BY MOUTH USING ORAL SOLUTION
- Child 2–11 years (body-weight 10–24 kg): 2.5 mg once daily
- Child 2–11 years (body-weight 25 kg and above): 5 mg once daily

- **CAUTIONS** History of QT-interval prolongation · predisposition to arrhythmia · uncorrected hypokalaemia
- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating
- **SIDE-EFFECTS**
- **Common or very common** Asthenia · dizziness · drowsiness · dry mouth · headache
- **Uncommon** Appetite increased · arthralgia · back pain · concentration impaired · constipation · cough · diarrhoea · dry throat · eosinophilia · epistaxis · fever · gastrointestinal discomfort · increased risk of infection · irritability · malaise · myalgia · nasal dryness · nausea · neutropenia · night sweats · oropharyngeal pain · skin reactions · thirst · vomiting · weight increased
- **Rare or very rare** Palpitations · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as rupatadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- **Rupatadine (Non-proprietary)**

Rupatadine (as Rupatadine fumarate) 1 mg per 1 ml Rupatadine 1mg/ml oral solution | 120 ml PoM £9.95–£13.10 DT = £13.10

Tablet

- **Rupatadine (Non-proprietary)**

Rupatadine (as Rupatadine fumarate) 10 mg Rupatadine 10mg tablets | 30 tablet PoM £68.15 DT = £60.72

Alimemazine tartrate

(Trimeprazine tartrate)

27-Apr-2021

- **INDICATIONS AND DOSE**

Urticaria | Pruritus

- BY MOUTH
- Child 6 months–1 year (specialist use only): 250 micrograms/kg 3–4 times a day (max. per dose 2.5 mg)
- Child 2–4 years: 2.5 mg 3–4 times a day
- Child 5–11 years: 5 mg 3–4 times a day
- Child 12–17 years: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day

Premedication to anaesthesia

- BY MOUTH
- Child 2–6 years: Up to 2 mg/kg, to be given 1–2 hours before operation

- **UNLICENSED USE** Expert sources advise alimemazine tartrate is used in children from the age of 6 months to 2 years for the treatment of urticaria and pruritus, but it is not licensed for this age group.
- **CONTRA-INDICATIONS** Children under 2 years except on specialist advice (risk of respiratory depression) · epilepsy · hepatic dysfunction · history of narrow angle glaucoma · hypothyroidism · myasthenia gravis · neonate (due to significant antimuscarinic activity) · Parkinson's disease · phaeochromocytoma · renal dysfunction
- **CAUTIONS** Cardiovascular diseases (due to tachycardia-inducing and hypotensive effects of phenothiazines) · exposure to sunlight should be avoided during treatment with high doses · pyloroduodenal obstruction · urinary retention · volume depleted patients who are more susceptible to orthostatic hypotension
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS** Agitation · agranulocytosis · amenorrhoea · atrioventricular block · autonomic dysfunction · bile thrombus · consciousness impaired · drug fever · dry mouth · eosinophilia · erectile dysfunction · eye disorder · galactorrhoea · gynaecomastia · hepatic disorders · hyperprolactinaemia · hyperthermia · hypotension · insomnia · leucopenia (on prolonged high dose) · movement disorders · muscle rigidity · nasal congestion · neuroleptic malignant syndrome · pallor · parkinsonism · photosensitivity reaction · postural hypotension (more common in the elderly or in volume depletion) · QT interval prolongation · respiratory depression · seizure · skin reactions · tardive dyskinesia (more common after long term high doses) · tremor · ventricular fibrillation (increased risk with hypokalamia and cardiac disease) · ventricular tachycardia (increased risk with hypokalamia and cardiac disease)

SIDE-EFFECTS, FURTHER INFORMATION Drowsiness may diminish after a few days.

Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight.

Children are more susceptible to side-effects.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** EvGr Avoid. Ⓜ
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

- **Alimemazine tartrate (Non-proprietary)**

Chlorphenamine maleate

26-Oct-2021

(Chlorpheniramine maleate)

- **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, urticaria, food allergy, drug reactions | Relief of itch associated with chickenpox

- BY MOUTH
- Child 1–23 months: 1 mg twice daily
- Child 2–5 years: 1 mg every 4–6 hours; maximum 6 mg per day
- Child 6–11 years: 2 mg every 4–6 hours; maximum 12 mg per day
- Child 12–17 years: 4 mg every 4–6 hours; maximum 24 mg per day

Symptomatic relief of allergy such as hay fever, urticaria, food allergy, drug reactions

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Child 1–5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
- Child 6 months–5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
- Child 6–11 years: 5 mg, repeated if necessary; maximum 4 doses per day
- Child 12–17 years: 10 mg, repeated if necessary; maximum 4 doses per day

Emergency treatment of anaphylactic reactions

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Child 1–5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
- Child 6 months–5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
- Child 6–11 years: 5 mg, repeated if necessary; maximum 4 doses per day
- Child 12–17 years: 10 mg, repeated if necessary; maximum 4 doses per day

- **UNLICENSED USE**
  - With oral use Expert sources advise that chlorphenamine may be used in children under 1 year of age for the treatment of allergies and of itch associated with chickenpox, but it is not licensed for this age group.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN (APRIL 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing chlorphenamine.

- **CONTRA-INDICATIONS** Neonate (due to significant antimuscarinic activity)
- **CAUTIONS** Epilepsy · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Concentration impaired · coordination abnormal · dizziness · dry mouth · fatigue · headache · nausea · vision blurred
- **Frequency not known** Agitation · appetite decreased · blood disorder · bronchial secretion viscosity increased · depression · diarrhoea · haemolytic anaemia · hypotension · irritability · muscle twitching · muscle weakness · nightmare · palpitations · photosensitivity reaction · skin reactions · tinnitus · urinary retention · vomiting

SPECIFIC SIDE-EFFECTS

- **Common or very common**
  - With oral use Drowsiness
- **Frequency not known**
  - With oral use Angioedema · arrhythmias · chest tightness · confusion · gastrointestinal discomfort · hepatic disorders
  - With parenteral use Central nervous system stimulation · dyspepsia · gastrointestinal disorder · hepatitis · sedation

SIDE-EFFECTS, FURTHER INFORMATION Children are more susceptible to side-effects.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, manufacturer advises give over 1 minute; if small dose required, dilute with Sodium Chloride 0.9%.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Chlorphenamine maleate for allergy www.medicinesforchildren.org.uk/medicines/chlorphenamine-maleate-for-allergy/

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Chlorphenamine tablets may be prescribed. Chlorphenamine oral solution may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - With intramuscular use or intravenous use Prescription only medicine restriction does not apply to chlorphenamine injection where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

- **Chlorphenamine maleate (Non-proprietary)**

Hydroxyzine hydrochloride

27-Apr-2021

- **DRUG ACTION** Hydroxyzine is a sedating antihistamine which exerts its actions by antagonising the effects of histamine.

- **INDICATIONS AND DOSE**

Pruritus

- BY MOUTH
- Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day
- Child 6–17 years (body-weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day
- Child 6–17 years (body-weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and torsade de pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT-interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia.

To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
- Consider the risks of QT-interval prolongation and torsade de pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
- In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
- The lowest effective dose for the shortest period of time should be prescribed.

- **CONTRA-INDICATIONS** Acquired or congenital QT interval prolongation · predisposition to QT interval prolongation

CONTRA-INDICATIONS, FURTHER INFORMATION

- QT interval prolongation Risk factors for QT interval prolongation include significant electrolyte imbalance, bradycardia, cardiovascular disease, and family history of sudden cardiac death.

- **CAUTIONS** Bladder outflow obstruction · breathing problems · cardiovascular disease · children · decreased gastrointestinal motility · dementia · epilepsy · hypertension · hyperthyroidism · myasthenia gravis · pyloroduodenal obstruction · stenosing peptic ulcer · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Children have an increased susceptibility to side-effects, particularly CNS effects.

- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**
  - **Rare or very rare** Severe cutaneous adverse reactions (SCARs) · skin reactions
  - **Frequency not known** Agranulocytosis · alopecia · anticholinergic syndrome · anxiety · appetite decreased · arrhythmias · asthenia · blood disorder · bronchial secretion viscosity increased · chest tightness · chills · coma · concentration impaired · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dry throat · dyskinesia (on discontinuation) · epigastric pain · fever · flushing · gastrointestinal disorders · haemolytic anaemia · hallucination · headache · hepatic function abnormal · hyperhidrosis · hypotension · irritability · labyrinthitis · leucopenia · malaise · menstruation irregular · movement disorders · myalgia · nasal congestion · nausea · palpitations · paraesthesia · QT interval prolongation · respiratory disorders · respiratory tract dryness · seizure (with high doses) · sexual dysfunction · sleep disorders · speech slurred · taste bitter ·

thrombocytopenia · tinnitus · tremor (with high doses) · urinary disorders · vertigo · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Paradoxical stimulation may occur rarely, especially with high doses. Drowsiness may diminish after a few days of treatment.

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises hydroxyzine should be avoided in patients with previous hypersensitivity to cetirizine or other piperazine derivatives, and aminophylline.
- **PREGNANCY** Manufacturers advise avoid—toxicity in *animal* studies with higher doses. Use in the latter part of the third trimester may cause irritability, paradoxical excitability, and tremor in the neonate.
- **BREAST FEEDING** Manufacturer advises avoid—expected to be present in milk but effect unknown.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (increased risk of accumulation); avoid in severe impairment.
  Dose adjustments Manufacturer advises dose reduction of 33% in mild to moderate impairment.
- **RENAL IMPAIRMENT** EvGr Use with caution. M
  Dose adjustments EvGr Reduce daily dose by half in moderate to severe renal impairment. M
- **EFFECT ON LABORATORY TESTS** May interfere with methacholine test—manufacturer advises stop treatment 96 hours prior to test. May interfere with skin testing for allergy—manufacturer advises stop treatment one week prior to test.
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2
EXCIPIENTS: May contain Alcohol, sucrose

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- **Hydroxyzine hydrochloride (Non-proprietary)**
  Hydroxyzine hydrochloride 10 mg Hydroxyzine 10mg tablets | 84 tablet PoM £4.50 DT = £2.36
  Hydroxyzine hydrochloride 25 mg Hydroxyzine 25mg tablets | 28 tablet PoM £1.49 DT = £1.13

Ketotifen

14-Dec-2020

- **INDICATIONS AND DOSE**

Allergic rhinitis

- BY MOUTH
- Child 3–17 years: 1 mg twice daily

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 688
- **CAUTIONS** Epilepsy · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · insomnia · irritability
  - **Uncommon** Cystitis · dizziness · dry mouth · skin reactions
  - **Rare or very rare** Hepatitis · sedation · seizure · Stevens-Johnson syndrome · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2, 21

- **Zaditen** (CD Pharma Srl)
  Ketotifen (as Ketotifen fumarate) 200 microgram per 1 ml Zaditen 1mg/5ml elixir sugar-free | 300 ml PoM £8.91 DT = £8.91

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 21

- **Zaditen** (CD Pharma Srl)
  Ketotifen (as Ketotifen fumarate) 1 mg Zaditen 1mg tablets | 60 tablet PoM £7.53 DT = £7.53

Promethazine hydrochloride

26-Apr-2021

- **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever and urticaria | Insomnia associated with urticaria and pruritus

- BY MOUTH
- Child 2–4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
- Child 5–9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
- Child 10–17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily

Sedation (short-term use)

- BY MOUTH
- Child 2–4 years: 15–20 mg
- Child 5–9 years: 20–25 mg
- Child 10–17 years: 25–50 mg

Sedation in intensive care

- BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Child 1 month–11 years: 0.5–1 mg/kg 4 times a day (max. per dose 25 mg), adjusted according to response
- Child 12–17 years: 25–50 mg 4 times a day, adjusted according to response

Nausea | Vomiting | Vertigo | Labyrinthine disorders | Motion sickness

- BY MOUTH
- Child 2–4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 5–9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 10–17 years: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

- **UNLICENSED USE** Not licensed for use for sedation in children under 2 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN (APRIL 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- **CONTRA-INDICATIONS** Neonate (due to significant antimuscarinic activity) · should not be given to children under 2 years, except on specialist advice, due to the potential for fatal respiratory depression
- **CAUTIONS**

GENERAL CAUTIONS Epilepsy · pyloroduodenal obstruction · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

SPECIFIC CAUTIONS

- With intravenous use Avoid extravasation with intravenous injection
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Arrhythmia · blood disorder · confusion · dizziness · drowsiness · dry mouth · headache · hypotension · jaundice · movement disorders · palpitations · photosensitivity reaction · urinary retention · vision blurred

SPECIFIC SIDE-EFFECTS

- With oral use Agranulocytosis · angle closure glaucoma · anticholinergic syndrome · anxiety · insomnia · leucopenia · nasal congestion · nausea · rash · seizure · thrombocytopenia · tinnitus · tremor · vomiting
- With parenteral use Appetite decreased · epigastric discomfort · fatigue · haemolytic anaemia · hypersensitivity · muscle spasms · nightmare · restlessness · skin reactions
- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** EvGr Use with caution. M
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed.

Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

- **LESS SUITABLE FOR PRESCRIBING** Promethazine is less suitable for prescribing for sedation.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

EXCIPIENTS: May contain Sulfites

VACCINES › ALLERGEN-TYPE VACCINES

Bee venom extract

28-Apr-2020

- **INDICATIONS AND DOSE**

Hypersensitivity to bee venom

- BY SUBCUTANEOUS INJECTION
- Child: (consult product literature)

IMPORTANT SAFETY INFORMATION

DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for licensed indications.

EvGr Desensitising vaccines should generally be avoided or used with particular care in patients with asthma. M

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **INTERACTIONS** → Appendix 1: bee venom extract
- **SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION Life-threatening hypersensitivity reactions can occur. Cardiopulmonary resuscitation must be immediately available. Manufacturer advises monitoring for at least 1 hour after injection.

- **PREGNANCY** Avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.
- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

NICE decisions

- ***Pharmalgen*® for the treatment of bee and wasp venom allergy (February 2012)** NICE TA246 Recommended with restrictions

- **MEDICINAL FORMS** No licensed medicines listed.

Grass pollen extract

17-Nov-2021

- **INDICATIONS AND DOSE**

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs

- BY SUBCUTANEOUS INJECTION
- Child: (consult product literature)

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs (initiated under specialist supervision)

- BY MOUTH
- Child 5–17 years: 1 tablet daily, treatment to be started at least 4 months before start of pollen season and continue for up to 3 years

IMPORTANT SAFETY INFORMATION

DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for licensed indications.

EvGr Desensitising vaccines should generally be avoided or used with particular care in patients with asthma. M

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **INTERACTIONS** → Appendix 1: grass pollen extract
- **SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the patient should be observed until these have resolved completely.

- **PREGNANCY** Should be avoided in pregnant women—consult product literature.
- **MONITORING REQUIREMENTS** The first dose of grass pollen extract (*Grazax*®) should be taken under medical supervision and the patient should be monitored for 20–30 minutes.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first should be taken under medical supervision and the patient should be monitored for 20–30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer oral lyophilisates.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Form unstated

- **Pollinex Grasses + Rye** (Allergy Therapeutics (UK) Ltd)
  Pollinex Grasses + Rye suspension for injection treatment and extension course vials | 4 vial PoM £450.00

Oral lyophilisate

- **Grazax** (ALK-Abello Ltd)
  Phleum pratense 75000 SQ-T Grazax 75,000 SQ-T oral lyophilisates sugar-free | 30 tablet PoM £80.12 DT = £80.12

House dust mite extract

17-Nov-2021

- **INDICATIONS AND DOSE**

Moderate to severe house dust mite allergic rhinitis [in patients who have failed to respond to anti-allergy drugs] (initiated by a specialist)

- BY MOUTH
- Child 12–17 years: 1 tablet daily for up to 18 months, consider discontinuation of treatment if no improvement during the first 12 months

IMPORTANT SAFETY INFORMATION

DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for licensed indications.

EvGr Desensitising vaccines should generally be avoided or used with particular care in patients with asthma. M

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions to house dust mite extracts can occur. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild,** the patient should be observed until these have resolved completely.

- **PREGNANCY** EvGr Avoid initiation during pregnancy—limited information available. If pregnancy occurs during treatment, *Acarizax*® may be continued after the general condition and lung function of the patient are evaluated, including reactions to previous doses—close supervision of patients with pre-existing asthma is recommended. M
- **DIRECTIONS FOR ADMINISTRATION** EvGr Oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first dose should be taken under medical supervision and the patient should be monitored for at least 30 minutes. M
- **PATIENT AND CARER ADVICE**

Administration Patients or carers should be given advice on how to administer oral lyophilisates.

Asthma Patients or carers should be advised to seek immediate medical attention if their asthma deteriorates suddenly during treatment.

Eosinophilic oesophagitis Patients or carers should be advised to seek medical attention if severe or persistent gastro-oesophageal symptoms (such as dysphagia or dyspepsia) develop during treatment.

Missed doses If treatment is interrupted for more than 7 days, patients or carers should be advised to seek medical advice before resuming treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral lyophilisate

- **Acarizax** (ALK-Abello Ltd)
  Acarizax 12 SQ-HDM oral lyophilisates sugar-free | 30 tablet PoM £80.12

Tree pollen extract

17-Nov-2021

- **INDICATIONS AND DOSE**

Treatment of seasonal allergic hay fever due to tree pollen in patients who have failed to respond to anti-allergy drugs

- BY SUBCUTANEOUS INJECTION
- Child: (consult product literature)

IMPORTANT SAFETY INFORMATION

2.1 Angioedema

Other drugs used for Angioedema Adrenaline/epinephrine, p. 149

DRUGS USED IN HEREDITARY ANGIOEDEMA › COMPLEMENT REGULATORY PROTEINS

C1-esterase inhibitor

30-Oct-2020

- **INDICATIONS AND DOSE**

BERINERT®

Acute attacks of hereditary angioedema (under expert supervision)

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: 20 units/kg

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: 15–30 units/kg (max. per dose 1000 units) for 1 dose, to be administered less than 6 hours before procedure

CINRYZE®

Acute attacks of hereditary angioedema (under expert supervision)

- BY SLOW INTRAVENOUS INJECTION
- Child 2–11 years (body-weight 10–25 kg): 500 units for 1 dose, dose may be repeated if necessary after 60 minutes
- Child 2–11 years (body-weight 26 kg and above): 1000 units for 1 dose, dose may be repeated if necessary after 60 minutes
- Child 12–17 years: 1000 units for 1 dose, dose may be repeated if necessary after 60 minutes (or sooner for patients experiencing laryngeal attacks or if treatment initiation is delayed)

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)

- BY SLOW INTRAVENOUS INJECTION
- Child 2–11 years (body-weight 10–25 kg): 500 units for 1 dose, to be administered up to 24 hours before procedure
- Child 2–11 years (body-weight 26 kg and above): 1000 units for 1 dose, to be administered up to 24 hours before procedure
- Child 12–17 years: 1000 units for 1 dose, to be administered up to 24 hours before procedure

Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)

- BY SLOW INTRAVENOUS INJECTION
- Child 6–11 years: 500 units every 3–4 days, dose and dosing interval to be adjusted according to response
- Child 12–17 years: 1000 units every 3–4 days, interval between doses to be adjusted according to response

- **CAUTIONS** Vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
- **Rare or very rare** Dizziness · dyspnoea · flushing · headache · hypersensitivity · hypertension · hypotension · nausea · tachycardia · thrombosis (with high doses) · urticaria
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **DIRECTIONS FOR ADMINISTRATION**

CINRYZE ® For *slow intravenous injection*, manufacturer advises reconstitute (with solvent provided) to a concentration of 100 units/mL; give at a rate of 1 mL/minute.

- **PRESCRIBING AND DISPENSING INFORMATION** C1-esterase inhibitor is prepared from human plasma.
- **NATIONAL FUNDING/ACCESS DECISIONS**

CINRYZE ® For full details see funding body website

All Wales Medicines Strategy Group (AWMSG) decisions

- **C1 inhibitor (human) (*Cinryze*®) for the treatment and pre-procedure prevention of attacks of hereditary angioedema (HAE) in patients 2 years old and above; routine prevention of angioedema attacks in patients 6 years old and above with severe and recurrent attacks of HAE, where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (October 2017)** AWMSG No. 3295 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Conestat alfa

15-Jun-2021

- **INDICATIONS AND DOSE**

Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency (under expert supervision)

- BY SLOW INTRAVENOUS INJECTION
- Child 2–11 years (body-weight up to 84 kg): 50 units/kg for 1 dose, to be administered over 5 minutes, dose may be repeated if there has been an inadequate response after 60 minutes; maximum 2 doses per day
- Child 2–11 years (body-weight 84 kg and above): 4200 units for 1 dose, to be administered over 5 minutes, dose may be repeated if there has been an inadequate response after 60 minutes; maximum 2 doses per day
- Child 12–17 years (body-weight up to 84 kg): 50 units/kg for 1 dose, to be administered over 5 minutes, dose may be repeated if there has been an inadequate response after 120 minutes; maximum 2 doses per day
- Child 12–17 years (body-weight 84 kg and above): 4200 units for 1 dose, to be administered over 5 minutes, dose may be repeated if there has been an inadequate response after 120 minutes; maximum 2 doses per day

- **CONTRA-INDICATIONS** Rabbit allergy
- **SIDE-EFFECTS**
- **Common or very common** Nausea
- **Uncommon** Abdominal discomfort · auricular swelling · diarrhoea · dizziness · headache · numbness · oral paraesthesia · throat irritation · urticaria · vertigo
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Caution—possible risk of hypersensitivity reaction in presence of a clinical allergy to cows' milk. Ⓜ
- **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Conestat alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of headache, vertigo or dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Conestat alfa (*Ruconest*®) for the treatment of acute angioedema attacks in adults and adolescents with hereditary angioedema (HAE) due to C1-esterase inhibitor deficiency (August 2018)** SMC No. 745/11 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions

- **Conestat alfa (*Ruconest*®) for the treatment of acute angioedema attacks in adults, adolescents and children (aged 2 years and above) with hereditary angioedema (HAE) due to C1-esterase inhibitor deficiency (May 2021)** AWMSG No. 4519 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

Conestat alfa 2100 unit Ruconest 2,100unit powder for solution for injection vials | 1 vial PoM £750.00 (Hospital only)

DRUGS USED IN HEREDITARY ANGIOEDEMA › KALLIKREIN INHIBITORS

Berotralstat

01-Apr-2022

- **DRUG ACTION** Berotralstat is a plasma kallikrein inhibitor, which limits the production of bradykinin, a potent vasodilator associated with angioedema attacks.

- **INDICATIONS AND DOSE**

Prevention of recurrent attacks of hereditary angioedema

▸ BY MOUTH

▸ Child 12–17 years (body-weight 40 kg and above): 150 mg once daily, dose to be taken with food

- **CONTRA-INDICATIONS** Body-weight less than 40 kg • not a treatment for acute attacks of angioedema—initiate individualised treatment for breakthrough attacks
- **CAUTIONS** Risk factors for QT prolongation

CAUTIONS, FURTHER INFORMATION

▸ QT prolongation EvGr If treatment with berotralstat is unavoidable, monitoring is recommended—consult product literature. M
- **INTERACTIONS** → Appendix 1: berotralstat
- **SIDE-EFFECTS**

▸ **Common or very common** Diarrhoea • gastrointestinal discomfort • gastrointestinal disorders • headaches • rash • vomiting

- **CONCEPTION AND CONTRACEPTION** EvGr Females of childbearing potential should use effective contraception during and for at least 1 month after last treatment. Efficacy of desogestrel-containing contraceptives may be reduced—consult product literature. M
- **PREGNANCY** EvGr Avoid—limited information available. M
- **BREAST FEEDING** EvGr Avoid—present in milk in *animal* studies. M
- **HEPATIC IMPAIRMENT** EvGr Avoid in moderate or severe impairment (risk of increased exposure). M
- **RENAL IMPAIRMENT** EvGr Avoid in severe impairment (increased risk of prolonged QT); if treatment is unavoidable, monitoring is required—consult product literature. M
- **PATIENT AND CARER ADVICE**

Missed doses If a dose is missed or not taken at the usual time, the missed dose should be taken as soon as possible on the same day. The next dose should be taken at the usual time.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

NICE decisions

▸ **Berotralstat for preventing recurrent attacks of hereditary angioedema (October 2021)** NICE TA738 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

▸ **Berotralstat (*Orladeyo*®) for the routine prevention of recurrent attacks of hereditary angioedema (HAE) in adult and adolescent patients aged 12 years and older (March 2022)** SMC No. SMC2405 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21

EXCIPIENTS: May contain Gelatin

▸ **Orladeyo** (BioCryst UK Ltd) ▼

Berotralstat (as Berotralstat dihydrochloride) 150 mg Orladeyo 150mg capsules | 28 capsule PoM £10,205.00 (Hospital only)

Lanadelumab

09-Nov-2020

- **DRUG ACTION** Lanadelumab is a humanised monoclonal antibody which inhibits plasma kallikrein activity, thereby limiting the production of bradykinin, a potent vasodilator associated with angioedema attacks in patients with hereditary angioedema.

- **INDICATIONS AND DOSE**

Prevention of recurrent attacks of hereditary angioedema (initiated under specialist supervision)

▸ BY SUBCUTANEOUS INJECTION

▸ Child 12–17 years: 300 mg every 2 weeks, reduced to 300 mg every 4 weeks, in those stable and attack free—consult product literature

- **CONTRA-INDICATIONS** Not a treatment for acute attacks of angioedema—initiate individualised treatment for breakthrough attacks
- **SIDE-EFFECTS**

▸ **Common or very common** Dizziness • hypersensitivity • myalgia • oral disorders • skin reactions

- **PREGNANCY** Manufacturer advises preferable to avoid—limited or no information available; *animal* studies do not indicate toxicity.
- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed.
- **EFFECT ON LABORATORY TESTS** Manufacturer advises may increase activated partial thromboplastin time (aPTT) due to an interaction with the aPTT assay—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to withdraw dose from the vial into a syringe with an 18 gauge needle and inject, using a suitable gauge needle, into the abdomen, thigh, or upper outer arm within 2 hours—consult product literature for further information. *Takhzyro*® may be self-administered or administered by a carer after appropriate training in subcutaneous injection technique.
- **PRESCRIBING AND DISPENSING INFORMATION** Lanadelumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE**

Self-administration Manufacturer advises patients and their carers should be given training in subcutaneous injection technique if appropriate.

Missed doses Manufacturer advises if a dose is missed, it should be taken as soon as possible ensuring at least 10 days between doses.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

NICE decisions

▸ **Lanadelumab for preventing recurrent attacks of hereditary angioedema (October 2019)** NICE TA606 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

▸ **Lanadelumab (*Takhzyro*®) for routine prevention of recurrent attacks of hereditary angioedema (HAE) in patients aged 12 years and older (December 2019)** SMC No. SMC2206 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Mucodyne** (Sanofi)

Carbocisteine 375 mg Mucodyne 375mg capsules | 120 capsule PoM £18.98 DT = £2.86

3.1 Cystic fibrosis

Cystic fibrosis

06-May-2020

Description of condition

Cystic fibrosis is a genetic disorder affecting the lungs, pancreas, liver, intestine, and reproductive organs. The main clinical signs are pulmonary disease, with recurrent infections and the production of copious viscous sputum, and malabsorption due to pancreatic insufficiency. Other complications include hepatobiliary disease, osteoporosis, cystic fibrosis-related diabetes, and distal intestinal obstruction syndrome.

Aims of treatment

The aim of treatment includes preventing and managing lung infections, loosening and removing thick, sticky mucus from the lungs, preventing or treating intestinal obstruction, and providing sufficient nutrition and hydration.

Lung function is a key predictor of life expectancy in people with cystic fibrosis and optimising lung function is a major aim of care.

Non-drug treatment

Specialist physiotherapists should assess patients with cystic fibrosis and provide advice on airway clearance, nebuliser use, musculoskeletal disorders, physical activity, and urinary incontinence. The importance of airway clearance techniques should be discussed with patients and their parents or carers and appropriate training provided. Patients should be advised that regular exercise improves both lung function and overall fitness.

Drug treatment

Treatment for cystic fibrosis lung disease is based on the prevention of lung infection and the maintenance of lung function. EvGr In patients with cystic fibrosis, who have clinical evidence of lung disease, the frequency of routine review should be based on their clinical condition, but children should be reviewed at least every 8 weeks. More frequent review is required immediately after diagnosis and during early life. A

For information on the management of patients during the COVID-19 pandemic, see COVID-19 p. 456.

Mucolytics

EvGr Patients with cystic fibrosis who have evidence of lung disease should be offered a mucolytic. Dornase alfa p. 203 is the first choice mucolytic [unlicensed in children under 5 years of age]. If there is an inadequate response, dornase alfa p. 203 and hypertonic sodium chloride p. 672, or hypertonic sodium chloride p. 672 alone should be considered.

Mannitol dry powder for inhalation p. 155 should be considered for children [unlicensed indication] who cannot use dornase alfa p. 203 and hypertonic sodium chloride p. 672 because of ineligibility, intolerance, or inadequate response. A

Lumacaftor with ivacaftor p. 205 is not recommended for treating cystic fibrosis within its marketing authorisation (see lumacaftor with ivacaftor p. 205 National funding/access decisions).

Pulmonary infection

Staphylococcus aureus

EvGr Flucloxacillin p. 395 [unlicensed indication] should be offered for prophylaxis against respiratory *Staphylococcus aureus* infection in children from the point of diagnosis up to 3 years of age. Continuing prophylaxis in children up to 6 years of age should also be considered. An alternative oral antibacterial should be given in children allergic to penicillin.

In children who are already taking prophylaxis and have a respiratory sample culture that is positive for *Staph. aureus*, prophylaxis adherence should be reviewed and antibacterial treatment started. A prophylactic antibacterial should be restarted after treatment (consult local protocol).

Patients who are not taking prophylaxis and have a new *Staph. aureus* infection can be given an oral anti- *Staph. aureus* antibacterial, if they are clinically well. If they are clinically unwell and have pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against *Staph. aureus* should be given (consult local protocol).

A long-term antibacterial should be considered to suppress **chronic** *Staph. aureus* respiratory infection in patients whose pulmonary disease is stable. In patients with chronic *Staph. aureus* respiratory infection who become clinically unwell with pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against *Staph. aureus* should be given. In those patients with new evidence of **meticillin-resistant *Staphylococcus aureus* (MRSA)** respiratory infection (with or without pulmonary exacerbation), specialist microbiological advice should be sought.

Antibacterials should not be routinely used to suppress chronic MRSA in patients with stable pulmonary disease.

If a patient with cystic fibrosis and chronic MRSA respiratory infection becomes unwell with a pulmonary exacerbation or shows a decline in pulmonary function, specialist microbiological advice should be sought. A

Pseudomonas aeruginosa

EvGr If a patient with cystic fibrosis develops a new *Pseudomonas aeruginosa* infection, eradication therapy with a course of oral antibacterial should be started (by intravenous injection, if they are clinically unwell), in combination with an inhaled antibacterial. An extended course of oral and inhaled antibacterial should follow (consult local protocol).

If eradication therapy is not successful, sustained treatment with an inhaled antibacterial should be offered. Nebulised colistimethate sodium p. 397 should be considered as first-line treatment (but see also colistimethate sodium p. 397 by dry powder inhalation National funding/access decisions).

In patients with **chronic** *Ps. aeruginosa* infection (when treatment has not eradicated the infection) who become clinically unwell with pulmonary exacerbations, an oral antibacterial or a combination of two intravenous antibacterial drugs of different classes (depending on infection severity) should be used. Changing antibacterial regimens should be considered to treat exacerbations (consult local protocol).

Nebulised aztreonam p. 380, nebulised tobramycin p. 355, or tobramycin dry powder for inhalation p. 355 [unlicensed indication in child under 6 years] (see tobramycin p. 355 National funding/access decisions) should be considered for those who are deteriorating despite regular inhaled colistimethate sodium p. 397. A

Burkholderia cepacia ***complex***

EvGr Patients who develop a new *Burkholderia cepacia* complex infection, should be given eradication therapy with a combination of intravenous antibacterial drugs (specialist microbiological advice should be sought on the choice of antibacterials). A There is no evidence to support using antibacterials to suppress **chronic** *Burkholderia cepacia* complex infection in patients with cystic fibrosis who have stable pulmonary status.

EvGr Specialist microbiological advice should be sought for patients with chronic *Burkholderia cepacia* complex infection (when treatment has not eradicated the infection) and who become clinically unwell with a pulmonary disease exacerbation.

An inhaled antibacterial should be considered for those who have chronic *Burkholderia cepacia* complex infection and declining pulmonary status; treatment should be stopped if there is no observed benefit. A

Haemophilus influenzae

EvGr *Haemophilus influenzae* infection in the absence of clinical evidence of pulmonary infection should be treated with an appropriate oral antibacterial drug. In those who are unwell with clinical evidence of pulmonary infection, an appropriate antibacterial should be given by mouth or intravenously depending on the severity of the illness (consult local protocol). A

Non-tuberculous mycobacteria

EvGr Non-tuberculous mycobacterial eradication therapy should be considered for patients with cystic fibrosis who are clinically unwell and whose pulmonary disease has not responded to other recommended treatments. Specialist microbiological advice should be sought on the choice of antibacterial and on the duration of treatment. A

Aspergillus fumigatus ***complex***

EvGr Treatment with an antifungal drug should only be considered to suppress **chronic** *Aspergillus fumigatus* complex respiratory infection in patients with declining

pulmonary status. Specialist microbiological advice should be sought on the choice of antifungal drug. [A]

Unidentified infections

EvGr An oral or intravenous (depending on the exacerbation severity) broad-spectrum antibacterial should be used for patients who have a pulmonary disease exacerbation and no clear cause. If a causative pathogen is identified, an appropriate treatment should be selected (consult local protocol). [A]

Immunomodulatory drugs

EvGr Long-term treatment with azithromycin p. 374 [unlicensed indication], at an immunomodulatory dose, should be offered to patients with deteriorating lung function or repeated pulmonary exacerbations. In those patients with continued deterioration in lung function or continuing pulmonary exacerbations, azithromycin p. 374 should be discontinued and the use of an oral corticosteroid considered. [A]

Nutrition and exocrine pancreatic insufficiency

EvGr A cystic fibrosis specialist dietitian should offer advice on optimal nutrition.

Pancreatin p. 54 should be offered to patients with exocrine pancreatic insufficiency. Dose should be adjusted as needed to minimise any symptoms or signs of malabsorption (see Exocrine pancreatic insufficiency p. 53). An acid-suppressing drug, such as an H_2 receptor antagonist or a proton pump inhibitor [unlicensed indications] can be considered for patients who have persistent symptoms or signs of malabsorption. [A]

Distal intestinal obstruction syndrome

EvGr Oral or intravenous fluids should be offered to ensure adequate hydration for patients with distal intestinal obstruction syndrome. Meglumine amidotrizoate with sodium amidotrizoate solution p. 39 (orally or via an enteral tube) should be considered as first-line treatment for distal intestinal obstruction syndrome. An iso-osmotic polyethylene glycol and electrolyte solution (macrogols) (orally or via an enteral tube) can be considered as a second-line treatment. Surgery is a last resort, if prolonged treatment with a polyethylene glycol solution is not effective. Suspected distal intestinal obstruction syndrome should be managed in a specialist cystic fibrosis centre. [A]

Liver disease

EvGr If liver function blood tests are abnormal in patients with cystic fibrosis, ursodeoxycholic acid p. 71 [unlicensed indication] can be given until liver function is restored. [A]

Bone mineral density

EvGr Patients should be monitored for cystic fibrosis-related low bone mineral density. [A]

Cystic fibrosis-related diabetes

EvGr Patients should be monitored for cystic fibrosis-related diabetes. [A]

MUCOLYTICS

Dornase alfa

17-Aug-2020

(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase))

- **DRUG ACTION** Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

- **INDICATIONS AND DOSE**

Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

▸ BY INHALATION OF NEBULISED SOLUTION

- Child 5–17 years: 2500 units once daily, administered by jet nebuliser

DOSE EQUIVALENCE AND CONVERSION

- Dornase alfa 1000 units is equivalent to 1 mg

- **SIDE-EFFECTS** Chest pain · conjunctivitis · dyspepsia · dysphonia · dyspnoea · fever · increased risk of infection · skin reactions
- **PREGNANCY** No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful—manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Dornase alfa is administered undiluted by inhalation using a jet nebuliser; ultrasonic nebulisers are unsuitable. Expert sources advise usually once daily at least 1 hour before physiotherapy.
- **PRESCRIBING AND DISPENSING INFORMATION** Not all children benefit from treatment with dornase alfa; improvement occurs within 2 weeks, but in more severely affected children a trial of 6–12 weeks may be required.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Dornase alfa for cystic fibrosis
  www.medicinesforchildren.org.uk/medicines/dornase-alfa-for-cystic-fibrosis/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

- Pulmozyme (Roche Products Ltd)
  Dornase alfa 1 mg per 1 ml Pulmozyme 2.5mg nebuliser liquid 2.5ml ampoules | 30 ampoule PoM £496.43 DT = £496.43

Ivacaftor

24-Mar-2022

- **DRUG ACTION** Ivacaftor is a cystic fibrosis transmembrane conductance regulator (CFTR) protein potentiator that increases chloride transport in the abnormal CFTR protein.

- **INDICATIONS AND DOSE**

Cystic fibrosis (specialist use only)

▸ BY MOUTH USING GRANULES

- Child 4–5 months (body-weight 5 kg and above): 25 mg every 12 hours
- Child 6 months–17 years (body-weight 5–6 kg): 25 mg every 12 hours
- Child 6 months–17 years (body-weight 7–13 kg): 50 mg every 12 hours
- Child 6 months–17 years (body-weight 14–24 kg): 75 mg every 12 hours
- Child 6–17 years (body-weight 25 kg and above): Use tablets

Cystic fibrosis (specialist use only)

▸ BY MOUTH USING TABLETS

- Child 6–17 years (body-weight 25 kg and above): 150 mg every 12 hours

continued →

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- EvGr *For tablets,* reduce dose to 150 mg twice a week with concurrent use of potent inhibitors of CYP3A4.
- *For tablets,* reduce dose to 150 mg once daily with concurrent use of moderate inhibitors of CYP3A4.
- *For children aged* 4–5 *months (body-weight* 5 *kg and above),* reduce dose of *granules* to 25 mg twice weekly or less frequently with concurrent use of potent or moderate inhibitors of CYP3A4; adjust dosing interval according to clinical response and tolerability.
- *For children aged* 6 *months to* 17 *years (body-weight* 5–6 *kg),* reduce dose of *granules* to 25 mg twice weekly with concurrent use of potent inhibitors of CYP3A4.
- *For children aged* 6 *months to* 17 *years (body-weight* 7–13 *kg),* reduce dose of *granules* to 50 mg twice weekly with concurrent use of potent inhibitors of CYP3A4.
- *For children aged* 6 *months to* 17 *years (body-weight* 14–24 *kg),* reduce dose of *granules* to 75 mg twice weekly with concurrent use of potent inhibitors of CYP3A4.
- *For children aged* 6 *months to* 17 *years,* reduce dose frequency of *granules* to once daily with concurrent use of moderate inhibitors of CYP3A4. M

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: IVACAFTOR, TEZACAFTOR, ELEXACAFTOR (*KAFTRIO*® ▼) IN COMBINATION WITH IVACAFTOR (*KALYDECO*®): RISK OF SERIOUS LIVER INJURY; UPDATED ADVICE ON LIVER FUNCTION TESTING (FEBRUARY 2022)

A European review of safety data identified a case of liver failure requiring transplantation in an adult patient, with pre-existing cirrhosis and portal hypertension, taking tezacaftor/ivacaftor/elexacaftor (*Kaftrio*® ▼) in combination with ivacaftor (*Kalydeco*®). Other cases of serious liver injury, characterised by elevations in alanine aminotransferase (ALT), aspartate aminotransferase (AST), and total bilirubin, were also identified in 2 adult patients, with no history of liver disease, taking this combination.

Healthcare professionals are advised to:

- measure total bilirubin levels in addition to ALT and AST levels before initiating treatment, every 3 months during the first year of treatment, and annually thereafter; more frequent monitoring should be considered in patients with a history of liver disease or transaminase elevations;
- use with caution and close monitoring in patients with advanced pre-existing liver disease, and only if the benefits outweigh the risks;
- promptly evaluate and measure liver function in patients who report symptoms that may indicate liver injury;
- discontinue treatment if significant elevation of liver enzymes occurs (see *Side-effects*), or signs and symptoms of liver injury develop; once liver abnormalities have resolved, consider the benefits and risks before resuming treatment.

Patients and carers should be counselled to seek immediate medical advice if signs of liver problems develop.

- **CAUTIONS** Organ transplantation (no information available)
- **INTERACTIONS** → Appendix 1: ivacaftor
- **SIDE-EFFECTS**
  - **Common or very common** Breast abnormalities · diarrhoea · dizziness · ear discomfort · headache · ototoxicity · rash · tympanic membrane hyperaemia
  - **Uncommon** Gynaecomastia
  - **Frequency not known** Cataract · hepatic function abnormal

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal *or* transaminase levels more than 3 times the upper limit of normal **and** blood bilirubin more than twice the upper limit of normal—consult product literature.

- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** EvGr Use with caution in moderate or severe impairment (limited information available). M EvGr Use with caution in children aged 4–5 months (body-weight 5 kg and above)—no information available. M

  Dose adjustments EvGr *For tablets,* reduce dose to 150 mg once daily in moderate impairment; in severe impairment reduce starting dose to 150 mg on alternate days or less frequently, adjust dosing interval according to clinical response and tolerability.

  For children aged 4–5 *months (body-weight* 5 *kg and above),* reduce dose of *granules* to 25 mg once daily or less frequently in impairment; adjust dosing interval according to clinical response and tolerability.

  For children aged 6 *months to* 17 *years (body-weight* 5–6 *kg),* reduce dose of *granules* to 25 mg once daily in moderate impairment; in severe impairment, reduce starting dose to 25 mg on alternate days, adjust dosing interval according to clinical response and tolerability.

  For children aged 6 *months to* 17 *years (body-weight* 7–13 *kg),* reduce dose of *granules* to 50 mg once daily in moderate impairment; in severe impairment, reduce starting dose to 50 mg on alternate days, adjust dosing interval according to clinical response and tolerability.

  For children aged 6 *months to* 17 *years (body-weight* 14–24 *kg),* reduce dose of *granules* to 75 mg once daily in moderate impairment; in severe impairment, reduce starting dose to 75 mg on alternate days, adjust dosing interval according to clinical response and tolerability. M
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment or end-stage renal disease—limited information available.
- **MONITORING REQUIREMENTS**
  - EvGr Monitor liver function before treatment, every 3 months during the first year of treatment, then annually thereafter (more frequent monitoring should be considered in patients with a history of liver disease or transaminase elevations).
  - Baseline and follow-up ophthalmic examinations are advised in children. M
- **DIRECTIONS FOR ADMINISTRATION** EvGr *Tablets* should be taken with fat-containing food.

  Granules should be mixed into 5 mL of soft food or liquid (at room temperature or below) and consumed immediately; if not immediately consumed, the mixture should be ingested within one hour. Fat-containing food should be consumed just before or after the dose is taken. M
- **PRESCRIBING AND DISPENSING INFORMATION** Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.
- **PATIENT AND CARER ADVICE**

  Missed doses EvGr If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. M

  Driving and skilled tasks EvGr Patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness. M

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Lumacaftor with ivacaftor

20-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 203.

● **INDICATIONS AND DOSE**

Cystic fibrosis (specialist use only)

▸ BY MOUTH USING GRANULES
▸ Child 2–5 years (body-weight up to 14 kg): 100/125 mg every 12 hours
▸ Child 2–5 years (body-weight 14 kg and above): 150/188 mg every 12 hours
▸ BY MOUTH USING TABLETS
▸ Child 6–11 years: 200/250 mg every 12 hours
▸ Child 12–17 years: 400/250 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▸ *For children aged* 2–5 *years (body-weight up to* 14 *kg)*, manufacturer advises reduce initial dose to 100/125 mg on alternate days for the first week in those also taking a potent inhibitor of CYP3A4.
▸ *For children aged* 2–5 *years (body-weight* 14 *kg and above)*, manufacturer advises reduce initial dose to 150/188 mg on alternate days for the first week in those also taking a potent inhibitor of CYP3A4.
▸ *For children aged* 6–11 *years*, manufacturer advises reduce initial dose to 100/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.
▸ *For children aged* 12–17 *years*, manufacturer advises reduce initial dose to 200/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.

DOSE EQUIVALENCE AND CONVERSION

▸ Dose expressed as x/y mg of lumacaftor/ivacaftor.

● **CAUTIONS** Forced expiratory volume in 1 second (FEV_1) less than 40% of the predicted normal value—additional monitoring recommended at initiation of treatment · pulmonary exacerbation—no information available

● **INTERACTIONS** → Appendix 1: ivacaftor · lumacaftor

● **SIDE-EFFECTS**

▸ **Common or very common** Breast abnormalities · diarrhoea · dizziness · ear discomfort · flatulence · gastrointestinal discomfort · headache · menstrual cycle irregularities · nausea · ototoxicity · rash · tympanic membrane hyperaemia · vomiting
▸ **Uncommon** Gynaecomastia · hepatic encephalopathy · hepatitis cholestatic · hypertension
▸ **Frequency not known** Cataract

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal *or* transaminase levels more than 3 times the upper limit of normal **and** blood bilirubin more than twice the upper limit of normal—consult product literature.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

Dose adjustments *For children aged* 2–5 *years (body-weight up to* 14 *kg),* manufacturer advises omit evening dose on alternate days in moderate impairment; in severe impairment, dose reduction to 100/125 mg every 24 hours is advised.

For children aged 2–5 *years (body-weight* 14 *kg and above),* manufacturer advises omit evening dose on alternate days in moderate impairment; in severe impairment, dose reduction to 150/188 mg every 24 hours is advised.

For children aged 6–11 *years,* manufacturer advises dose reduction of evening dose to 100/125 mg in moderate impairment; in severe impairment, dose reduction to 100/125 mg every 12 hours is advised.

For children aged 12–17 *years,* manufacturer advises dose reduction of evening dose to 200/125 mg in moderate impairment; in severe impairment, dose reduction to 200/125 mg every 12 hours is advised.

● **PRE-TREATMENT SCREENING** If the patient's genotype is unknown, a validated genotyping method should be performed to confirm the presence of the F508del mutation on both alleles of the CFTR gene before starting treatment.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure periodically during treatment.

● **EFFECT ON LABORATORY TESTS** False positive urine screening tests for tetrahydrocannabinol have been reported—manufacturer advises consider alternative confirmatory method.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises *tablets* and *granules* should be taken with fat-containing food. For *granules*, the contents of each sachet should be mixed with 1 teaspoon (5 mL) of soft food or liquid (e.g. puréed fruits, yoghurt, milk, or juice), at room temperature or below, and consumed within an hour.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets.

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Tezacaftor with ivacaftor

16-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 203.

INDICATIONS AND DOSE

Cystic fibrosis (in combination with ivacaftor) (specialist use only)

- BY MOUTH
- Child 12–17 years: 100/150 mg, to be taken in the morning and, *Ivacaftor* 150 mg to be taken in the evening

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- With concurrent use of potent CYP3A4 inhibitors, manufacturer advises reduce dose to 100/150 mg tezacaftor/ivacaftor twice a week, taken approximately 3–4 days apart; the evening dose of ivacaftor should not be taken.
- With concurrent use of moderate CYP3A4 inhibitors, manufacturer advises reduce dose to 100/150 mg tezacaftor/ivacaftor every other morning, with ivacaftor 150 mg taken in the mornings alternate to tezacaftor/ivacaftor; the evening dose of ivacaftor should not be taken.

DOSE EQUIVALENCE AND CONVERSION

- Combination dose expressed as x/y mg of tezacaftor/ivacaftor.

INTERACTIONS

→ Appendix 1: ivacaftor · tezacaftor

SIDE-EFFECTS

- **Common or very common** Abdominal pain · breast abnormalities · diarrhoea · dizziness · ear discomfort · headache · nausea · ototoxicity · rash · tympanic membrane hyperaemia
- **Uncommon** Gynaecomastia
- **Frequency not known** Hepatic function abnormal · lens opacity

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal *or* transaminase levels more than 3 times the upper limit of normal **and** blood bilirubin more than twice the upper limit of normal—consult product literature.

HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

Dose adjustments Manufacturer advises omit evening dose of ivacaftor in moderate to severe impairment; in severe impairment, adjust dosing interval according to clinical response and tolerability.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Tezacaftor with ivacaftor (*Symkevi*®) for the treatment of patients with cystic fibrosis aged 12 years and older who are homozygous for the F508del mutation or who are heterozygous for the F508del mutation and have one of the following mutations in the cystic fibrosis transmembrane conductance regulator (CFTR) gene P67L, R117C, L206W, R352Q, A455E, D579G, 711+3A→G, S945L, S977F, R1070W, D1152H, 2789+5G→A, 3272-26A→G, and 3849+10kbC→T (August 2019)** SMC No. SMC2183 Not recommended

Tezacaftor with ivacaftor and elexacaftor

25-Mar-2022

The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 203, tezacaftor with ivacaftor above.

INDICATIONS AND DOSE

Cystic fibrosis (in combination with ivacaftor) (specialist use only)

- BY MOUTH
- Child 12–17 years: 2 tablets, to be taken in the morning and, *Ivacaftor* 150 mg to be taken in the evening (about 12 hours apart)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- With concurrent use of potent CYP3A4 inhibitors, manufacturer advises reduce dose to 2 tablets twice a week, taken approximately 3–4 days apart; the evening dose of ivacaftor should not be taken.
- With concurrent use of moderate CYP3A4 inhibitors, manufacturer advises reduce dose to 2 tablets every other morning, with ivacaftor 150 mg taken in the mornings alternate to tezacaftor/ivacaftor/elexacaftor; the evening dose of ivacaftor should not be taken.

DOSE EQUIVALENCE AND CONVERSION

- Tablet quantities refer to the number of *Kaftrio*® Tablets which should be taken. Each *Kaftrio*® Tablet contains tezacaftor 50 mg, ivacaftor 75 mg, and elexacaftor 100 mg.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: IVACAFTOR, TEZACAFTOR, ELEXACAFTOR (*KAFTRIO*® ▼) IN COMBINATION WITH IVACAFTOR (*KALYDECO*®): RISK OF SERIOUS LIVER INJURY; UPDATED ADVICE ON LIVER FUNCTION TESTING (FEBRUARY 2022)

A European review of safety data identified a case of liver failure requiring transplantation in an adult patient, with pre-existing cirrhosis and portal hypertension, taking tezacaftor/ivacaftor/elexacaftor (*Kaftrio*® ▼) in combination with ivacaftor (*Kalydeco*®). Other cases of serious liver injury, characterised by elevations in alanine aminotransferase (ALT), aspartate aminotransferase (AST), and total bilirubin, were also identified in 2 adult patients, with no history of liver disease, taking this combination.

Healthcare professionals are advised to:

- measure total bilirubin levels in addition to ALT and AST levels before initiating treatment, every 3 months during the first year of treatment, and annually thereafter; more frequent monitoring should be considered in patients with a history of liver disease or transaminase elevations;
- use with caution and close monitoring in patients with advanced pre-existing liver disease, and only if the benefits outweigh the risks;

- promptly evaluate and measure liver function in patients who report symptoms that may indicate liver injury;
- discontinue treatment if significant elevation of liver enzymes occurs (see *Side-effects* of ivacaftor p. 203), or signs and symptoms of liver injury develop; once liver abnormalities have resolved, consider the benefits and risks before resuming treatment.

Patients and carers should be counselled to seek immediate medical advice if signs of liver problems develop.

- **INTERACTIONS** → Appendix 1: elexacaftor · ivacaftor · tezacaftor
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment; use only if potential benefit outweighs risk in moderate impairment (risk of increased exposure). **Dose adjustments** Manufacturer advises alternate dose between 1 and 2 tablets in the mornings, and omit evening dose of ivacaftor in moderate impairment.
- **PATIENT AND CARER ADVICE** **Missed doses** Manufacturer advises if the morning dose is more than 6 hours late, the missed dose should be taken and the evening dose of ivacaftor omitted; the next morning dose should be taken at the normal time. If the evening dose of ivacaftor is more than 6 hours late, the missed dose should **not** be taken and the next morning dose should be taken at the normal time.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

4 Cough and congestion

Aromatic inhalations, cough preparations and systemic nasal decongestants

Aromatic inhalations

Inhalations containing volatile substances such as eucalyptus oil are traditionally used to relieve congestion and ease breathing. Although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting. Boiling water should not be used owing to the risk of scalding.

Strong aromatic decongestants (applied as rubs or to pillows) are not recommended for infants under the age of 3 months. Sodium chloride 0.9% solution p. 672 given as nasal drops can be used to liquefy mucous secretions and relieve nasal congestion in infants and young children; administration before feeds may ease feeding difficulties caused by nasal congestion.

Cough preparations

Cough suppressants

Cough may be a symptom of an underlying disorder such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be associated with smoking or environmental pollutants. Cough can also result from bronchiectasis including that associated with cystic fibrosis; cough can also have a significant habit component. There is little evidence of any significant benefit from the use of cough suppressants in children with acute cough in ambulatory settings. Cough suppressants may cause sputum retention and this can be harmful in children with bronchiectasis.

The use of cough suppressants containing pholcodine p. 208 or similar opioid analgesics is not generally recommended in children and should be avoided in children under 6 years; the use of over-the-counter cough suppressants containing codeine phosphate p. 308 should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Demulcent and expectorant cough preparations

Simple linctus and other demulcent cough preparations containing soothing substances, such as syrup or glycerol, may temporarily relieve a dry irritating cough. These preparations have the advantage of being harmless and inexpensive and sugar-free versions are available.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

EvGr An over-the-counter cough medicine containing the expectorant guaifenesin may be used for acute cough in children aged over 12 years; there is some evidence to suggest it may reduce symptoms. A

Compound cough preparations for children are on sale to the public but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 193, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- Phenylephrine hydrochloride p. 138, pseudoephedrine hydrochloride p. 789, ephedrine hydrochloride p. 789, oxymetazoline, or xylometazoline hydrochloride p. 789 (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

Nasal decongestants, systemic

Nasal congestion in children due to allergic or vasomotor rhinitis should be treated with oral antihistamines, topical nasal preparations containing corticosteroids, or topical decongestants.

There is little evidence to support the use of systemic decongestants in children.

Pseudoephedrine hydrochloride has few sympathomimetic effects, and is commonly combined with other ingredients (including antihistamines) in preparations intended for the relief of cough and cold symptoms.

COUGH AND COLD PREPARATIONS › COUGH SUPPRESSANTS

Pholcodine

05-Jul-2021

● **INDICATIONS AND DOSE**

Dry cough

► BY MOUTH USING LINCTUS

- Child 6–11 years: 2–5 mg 3–4 times a day
- Child 12–17 years: 5–10 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing pholcodine (cough suppressant).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

● **CONTRA-INDICATIONS** Bronchiectasis · bronchiolitis · chronic bronchitis · patients at risk of respiratory failure

● **CAUTIONS** Asthma · chronic cough · history of drug abuse · persistent cough · productive cough

● **INTERACTIONS** → Appendix 1: pholcodine

● **SIDE-EFFECTS** Agitation · confusion · constipation · dizziness · drowsiness · gastrointestinal disorder · nausea · skin reactions · sputum retention · vomiting

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in hepatic failure.

● **RENAL IMPAIRMENT** EvGr Use with caution. Ⓜ

● **PRESCRIBING AND DISPENSING INFORMATION** Pholcodine is not generally recommended for children.

Flavours of oral liquid formulations may include orange.

When prepared extemporaneously, the BP states Pholcodine Linctus, BP consists of pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1% and Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- **Pholcodine (Non-proprietary)**
  Pholcodine 1 mg per 1 ml Pholcodine 5mg/5ml linctus | 200 ml P £1.23–£1.41 DT = £1.32 CD5

  Friars' Balsam | 50 ml GSL £2.11

5 Respiratory depression, respiratory distress syndrome and apnoea

Respiratory stimulants

Respiratory stimulants

Respiratory stimulants (analeptic drugs), such as caffeine citrate p. 210, reduce the frequency of neonatal apnoea, and the need for mechanical ventilation during the first 7 days of treatment. They are typically used in the management of very preterm neonates, and continued until a corrected gestational age of 34 to 35 weeks is reached (or longer if necessary). They should only be given under **expert supervision** in hospital; it is important to rule out any underlying disorder, such as seizures, hypoglycaemia, or infection, causing respiratory exhaustion before starting treatment with a respiratory stimulant.

Pulmonary surfactants

Pulmonary surfactants derived from animal lungs, beractant below and poractant alfa below are used to prevent and treat respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. Prophylactic use of a pulmonary surfactant may reduce the need for mechanical ventilation and is more effective than 'rescue treatment' in preterm neonates of 29 weeks or less corrected gestational age. Pulmonary surfactants may also be of benefit in neonates with meconium aspiration syndrome or intrapartum streptococcal infection. Pulmonary immaturity with surfactant deficit is the commonest reason for respiratory failure in the neonate, especially in those of less than 30 weeks corrected gestational age. Betamethasone p. 504 given to the mother (at least 12 hours but preferably 48 hours) before delivery substantially enhances pulmonary maturity in the neonate.

PULMONARY SURFACTANTS

Beractant

29-Apr-2020

- **INDICATIONS AND DOSE**

Treatment of respiratory distress syndrome in preterm neonates, birth-weight over 700 g (specialist use only)

- BY ENDOTRACHEAL TUBE
- Preterm neonate: 100 mg/kg, preferably administer within 8 hours of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

Prophylaxis of respiratory distress syndrome in preterm neonates (specialist use only)

- BY ENDOTRACHEAL TUBE
- Neonate up to 32 weeks corrected gestational age: 100 mg/kg, preferably administer within 15 minutes of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

DOSE EQUIVALENCE AND CONVERSION

- Phospholipid 100 mg/kg is equivalent to a volume of 4 mL/kg.

- **CAUTIONS** Consult product literature
- **SIDE-EFFECTS**
- **Uncommon** Endotracheal tube obstruction
- **Frequency not known** Bradycardia · hypoxia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Liquid

- **Survanta** (AbbVie Ltd)
  Phospholipids (as Beractant) 25 mg per 1 ml Survanta 200mg/8ml endotracheopulmonary suspension bottles | 1 bottle PoM £306.43 (Hospital only)

Poractant alfa

29-Apr-2020

- **INDICATIONS AND DOSE**

Treatment of respiratory distress syndrome in neonates, birth weight over 700 g (specialist use only)

- BY ENDOTRACHEAL TUBE
- Neonate: 100–200 mg/kg, then 100 mg/kg every 12 hours if required, maximum 300–400 mg/kg per course.

Prophylaxis of respiratory distress syndrome (specialist use only)

- BY ENDOTRACHEAL TUBE
- Neonate 24 weeks to 31 weeks corrected gestational age: 100–200 mg/kg, administer soon after birth, preferably within 15 minutes, then 100 mg/kg after 6–12 hours if required, then 100 mg/kg after 12 hours if required, and if neonate still intubated. Max 300–400 mg/kg per course.

- **CAUTIONS** Consult product literature
- **SIDE-EFFECTS**
- **Rare or very rare** Bradycardia · hypotension
- **Frequency not known** Hyperoxia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Liquid

- **Curosurf** (Chiesi Ltd)
  Poractant alfa 80 mg per 1 ml Curosurf 240mg/3ml endotracheopulmonary suspension vials | 1 vial PoM £547.40 (Hospital only)

5.1 Neonatal apnoea

XANTHINES

Caffeine citrate

07-May-2021

● **INDICATIONS AND DOSE**

Neonatal apnoea (specialist supervision in hospital)

▸ BY MOUTH, OR BY INTRAVENOUS INFUSION

▸ Neonate: Loading dose 20 mg/kg, then maintenance 5 mg/kg once daily, started 24 hours after the loading dose; increased if necessary up to 20 mg/kg daily, a maintenance dose above 20 mg/kg daily can be considered if therapeutic efficacy is not achieved—the plasma-caffeine concentration should be monitored to ensure that a safe level is maintained.

DOSE EQUIVALENCE AND CONVERSION

▸ Caffeine citrate 2 mg ≡ caffeine base 1 mg

PHARMACOKINETICS

▸ Caffeine citrate is well absorbed when given orally.

● **UNLICENSED USE** EvGr Higher maintenance doses differ from product literature and adhere to national guidelines Ⓐ.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SAFE PRACTICE

From August 2013, all licensed preparations of caffeine are required to be labelled as caffeine citrate. To minimise the risk of dosing errors, **always state dose in terms of caffeine citrate when prescribing caffeine**.

Some stock packaged as caffeine base.

● **CAUTIONS** Cardiovascular disease · gastro-oesophageal reflux · rhythm disorder · seizure disorders

● **INTERACTIONS** → Appendix 1: caffeine citrate

● **SIDE-EFFECTS**

▸ **Common or very common** Arrhythmias · hyperglycaemia

▸ **Uncommon** Seizure

▸ **Frequency not known** Brain injury · deafness · failure to thrive · feeding intolerance · feeling jittery · gastrointestinal disorders · hypoglycaemia · increased cardiac output · irritability · regurgitation · restlessness

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased frequency of side-effects).

Dose adjustments Manufacturer advises consider dose adjustment according to plasma-caffeine concentration.

● **RENAL IMPAIRMENT** EvGr Use with caution (potential for accumulation). Ⓜ

Dose adjustments EvGr Reduced daily maintenance dose required (consult product literature). Ⓜ

● **MONITORING REQUIREMENTS**

▸ EvGr The therapeutic range for plasma-caffeine concentration is usually 10–20 mg/litre (50–100 micromol/litre), but a concentration of 25–35 mg/litre (130–180 micromol/litre) may be required. Signs of toxicity only normally occur at concentrations greater than 50 mg/litre (260 micromol/litre). Ⓓ

▸ Monitor for recurrence of apnoea for 1 week after stopping treatment.

● **DIRECTIONS FOR ADMINISTRATION** Caffeine citrate injection may be administered *by mouth* or *by intravenous infusion*. For *intravenous infusion*, manufacturer advises give loading dose over 30 minutes and maintenance doses over 10 minutes.

Nervous system

CONTENTS

1 Epilepsy and other seizure disorders

Epilepsy

14-Jul-2021

Epilepsy control

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The frequency of administration is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage better adherence. Most antiepileptics, when used in usual dosage, can be given twice daily. Lamotrigine p. 225, perampanel p. 229, phenobarbital p. 243 and phenytoin p. 230, which have long half-lives, can be given as a daily dose at bedtime. However, with large doses, some antiepileptics may need to be given three times daily to avoid adverse effects associated with high peak plasma-drug concentrations. Young children metabolise some antiepileptics more rapidly than adults and therefore may require more frequent doses and a higher amount per kilogram body-weight.

Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible and will achieve seizure control for the majority of children.

MHRA/CHM advice: Antiepileptics: risk of suicidal thoughts and behaviour (August 2008)

A Europe-wide review concluded that all antiepileptic drugs may be associated with a small increased risk of suicidal thoughts and behaviour; symptoms may occur as early as 1 week after starting treatment. The MHRA has recommended that children and their parents or carers should be advised to seek medical advice if any mood changes, distressing thoughts, or feelings about suicide or self-harming develop, and that the child should be referred for appropriate treatment if necessary. They should also be advised not to stop or switch antiepileptic treatment and to seek advice from a healthcare professional if concerned.

MHRA/CHM advice: Antiepileptic drugs: updated advice on switching between different manufacturers' products (November 2017)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers' products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer's product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer's product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in

other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

Category 1

Carbamazepine p. 218, **phenobarbital**, **phenytoin**, **primidone p. 244**. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer's product.

Category 2

Clobazam p. 246, **clonazepam p. 247**, **eslicarbazepine acetate p. 220**, **lamotrigine**, **oxcarbazepine p. 228**, **perampanel**, **rufinamide p. 232**, **topiramate p. 238**, **valproate**, **zonisamide p. 242**. For these drugs, the need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency, treatment history, and potential implications to the patient of having a breakthrough seizure. Non-clinical factors as for Category 3 drugs should also be considered.

Category 3

Brivaracetam p. 216, **ethosuximide p. 221**, **gabapentin p. 223**, **lacosamide p. 224**, **levetiracetam p. 227**, **pregabalin**, **tiagabine p. 237**, **vigabatrin p. 241**. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer's product as therapeutic equivalence can be assumed, however, other factors are important when considering whether switching is appropriate. Differences between alternative products (e.g. product name, packaging, appearance, and taste) may be perceived negatively by patients and/or carers, and may lead to dissatisfaction, anxiety, confusion, dosing errors, and reduced adherence. In addition, difficulties for patients with co-morbid autism, mental health problems, or learning disability should also be considered.

Antiepileptic hypersensitivity syndrome

Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (eslicarbazepine acetate, stiripentol p. 237, and zonisamide) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the child should not be re-exposed, and expert advice should be sought.

Interactions

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

Withdrawal

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free child, and its timing, is often difficult and depends on individual circumstances. Even in children who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal.

Drugs should be gradually withdrawn over at least 2–3 months by reducing the daily dose by 10–25% at intervals of 1–2 weeks. Benzodiazepines may need to be withdrawn over 6 months or longer.

In children receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Monitoring

Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma-drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected non-compliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

Plasma concentration of some medications may change during pregnancy and monitoring may be required (see under *Pregnancy*).

Driving

If a driver has a seizure (of any type) they must stop driving immediately and inform the Driver and Vehicle Licensing Agency (DVLA).

Patients who have had a first unprovoked epileptic seizure or a single isolated seizure must not drive for 6 months; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive and investigations do not suggest a risk of further seizures.

Patients with established epilepsy may drive a motor vehicle provided they are not a danger to the public and are compliant with treatment and follow up. To continue driving, these patients must be seizure-free for at least one year (or have a pattern of seizures established for one year where there is no influence on their level of consciousness or the ability to act); also, they must not have a history of unprovoked seizures.

Patients who have had a *seizure while asleep* are not permitted to drive for one year from the date of each seizure unless:
- a history or pattern of sleep seizures occurring **only** ever while asleep has been established over the course of at least one year from the date of the first sleep seizure; or
- an established pattern of purely asleep seizures can be demonstrated over the course of three years if the patient has previously had seizures whilst awake (or awake and asleep).

The DVLA recommends that patients should not drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months after their last dose. If a seizure occurs due to a prescribed change or withdrawal of epilepsy treatment, the patient will have their driving license revoked for 1 year; relicensing may be considered earlier if treatment has been reinstated for 6 months and no further seizures have occurred.

Pregnancy

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient is taking two or more antiepileptic drugs).

MHRA/CHM advice: Antiepileptic drugs in pregnancy: updated advice following comprehensive safety review (January 2021)
Valproate, in particular, is highly teratogenic and evidence supports that use in pregnancy leads to congenital malformations (approximately 10% risk) and neurodevelopmental disorders (approximately 30–40% risk). Prescribers are reminded that valproate must **not** be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. Valproate must not be used during pregnancy unless there is no other suitable alternative. For further information, see sodium valproate p. 233 and valproic acid p. 239.

In the context of the known harms associated with valproate, the CHM initiated a safety review on the use of other key antiepileptic drugs in pregnancy for the risk of major congenital malformations, neurodevelopmental disorders or delay, and other effects on the child. Safety data for carbamazepine, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, phenobarbital, phenytoin, pregabalin, topiramate, and zonisamide were reviewed. Much of the evidence base related to epilepsy, and as such, the review focused on the risks and decisions for epilepsy treatment.

The review confirmed that lamotrigine and levetiracetam are the safer of the drugs reviewed; large studies of pregnancies exposed to lamotrigine or levetiracetam monotherapy did not suggest an increased risk of major congenital malformations (at usual maintenance doses). Data for neurodevelopmental outcomes were more limited; available studies did not suggest an increased risk of neurodevelopmental disorders or delay associated with in-utero exposure to either lamotrigine or levetiracetam, however the data were inadequate to completely rule out the possibility of an increased risk. Lamotrigine and levetiracetam were not associated with an increased risk of fetal loss, intra-uterine growth restriction, or preterm birth.

For carbamazepine, phenobarbital, phenytoin, and topiramate, the data showed that use during pregnancy was associated with an increased risk of major congenital malformations; the risk for carbamazepine, phenobarbital, and topiramate was shown to be dose dependent. There is the possibility of adverse effects on neurodevelopment associated with the use of phenobarbital and phenytoin, and an increased risk of intra-uterine growth restriction with phenobarbital, topiramate, and zonisamide. The available data for carbamazepine did not suggest an increased risk of neurodevelopmental disorders or delay associated with in-utero exposure; however, the data were inadequate to completely rule out the possibility of an increased risk. For information on other antiepileptic drugs, see *Pregnancy* in the individual drug monographs.

Specialists should discuss the risks associated with antiepileptic drugs and untreated epilepsy during pregnancy with female patients when initiating treatment and during annual reviews; a safety information leaflet is available to aid discussion. Treatment should be reviewed according to the patient's clinical condition and circumstance. Female patients should be advised not to stop their antiepileptic treatment without discussing this with their doctor, and to seek urgent medical advice if they are on antiepileptic drugs and think they could be pregnant. Those who are planning a pregnancy should be urgently referred to a specialist for advice on antiepileptic treatment and offered folic acid.

With any antiepileptic drug used during pregnancy, monotherapy and use of the lowest effective dose are recommended where possible. Plasma concentrations of antiepileptic drugs (particularly lamotrigine and phenytoin) can be affected by physiological changes during pregnancy and post-partum. Prescribers should consult product literature and relevant clinical guidance for dosing and monitoring recommendations. For further information, also see *Monitoring in Pregnancy* in the individual drug monographs.

Other considerations
Prescribers should also carefully consider the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Females of childbearing potential who take antiepileptic drugs should be given advice about the need for a highly effective contraception method to avoid unplanned pregnancy—for further information, see *Contraception in patients taking medication with teratogenic potential* in Contraceptives, hormonal p. 561. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that female patients do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folate supplementation is advised throughout the first trimester. In the case of sodium valproate p. 233 and valproic acid p. 239 an urgent consultation is required to reconsider the benefits and risks of valproate therapy.

Female patients who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics.

Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital, and can take several days to diminish.

Epilepsy and Pregnancy Register
All pregnant females with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (available at: www.epilepsyandpregnancy.co.uk).

Breast-feeding
Young women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant's drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

Focal seizures with or without secondary generalisation

Carbamazepine p. 218 and lamotrigine p. 225 are the drugs of choice for focal seizures; levetiracetam p. 227,

oxcarbazepine p. 228, and sodium valproate can be considered if these are unsuitable. These drugs may also be used as adjunctive treatment. Other adjunctive options include clobazam p. 246, gabapentin p. 223, and topiramate p. 238. If adjunctive treatment is ineffective or not tolerated, a tertiary specialist should be consulted who may consider eslicarbazepine acetate p. 220, lacosamide p. 224, phenobarbital p. 243, phenytoin p. 230, pregabalin [unlicensed], tiagabine p. 237, vigabatrin p. 241, and zonisamide p. 242.

Generalised seizures

Tonic-clonic seizures

The drug of choice for newly diagnosed tonic-clonic seizures in children is sodium valproate (except in female patients, see *Valproate* below), or lamotrigine where sodium valproate is unsuitable (but may exacerbate myoclonic seizures). In children with established epilepsy with generalised tonic-clonic seizures only, lamotrigine may be prescribed as the first-line choice. Carbamazepine or oxcarbazepine can also be considered but may exacerbate myoclonic or absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate, or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures

Ethosuximide p. 221 and sodium valproate (except in female patients, see *Valproate* below) are the drugs of choice for absence seizures and syndromes; lamotrigine can be used if these are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Second-line therapy includes clobazam, clonazepam p. 247, levetiracetam, topiramate or zonisamide which may be considered by a tertiary specialist if adjunctive treatment fails. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin are not recommended in absence seizures or syndromes.

Myoclonic seizures

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice (except in female patients, see *Valproate* below); consider levetiracetam or topiramate if sodium valproate is unsuitable (but consider the less favourable side-effect profile of topiramate). A combination of two of these drugs may be used if monotherapy is ineffective or poorly tolerated. Second-line therapy includes clobazam, clonazepam, piracetam or zonisamide which should be prescribed under the supervision of a tertiary specialist. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin are not recommended for the treatment of myoclonic seizures.

Tonic and atonic seizures

Tonic or atonic seizures are treated with sodium valproate (except in female patients, see *Valproate* below); lamotrigine can be considered as adjunctive treatment if sodium valproate is ineffective or not tolerated. If adjunctive treatment fails, a tertiary specialist should be consulted who may consider rufinamide p. 232 or topiramate. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine, and vigabatrin are not recommended in atonic or tonic seizures.

Epilepsy syndromes

Infantile spasms

Vigabatrin is the drug of choice for infantile spasms associated with tuberous sclerosis. Corticosteroids, such as prednisolone p. 508 or tetracosactide p. 538, are second-line options if vigabatrin is ineffective. In spasms of other causes, vigabatrin, prednisolone, or tetracosactide can be considered as first-line options. A tertiary specialist should be consulted before treating infantile spasms.

Dravet syndrome

A tertiary specialist should be involved in decisions regarding treatment of Dravet syndrome. Sodium valproate p. 233 (except in pregnancy or females of childbearing potential, see *Valproate* below) or topiramate [unlicensed] are first-line treatment options in Dravet syndrome. Clobazam p. 246 or stiripentol p. 237 may be considered as adjunctive treatment if first-line treatments are ineffective or not tolerated. Cannabidiol p. 217 with clobazam may also be an appropriate treatment option in certain children. Carbamazepine p. 218, gabapentin p. 223, lamotrigine p. 225, oxcarbazepine p. 228, phenytoin p. 230, pregabalin, tiagabine p. 237, and vigabatrin p. 241 should not be used as they may exacerbate myoclonic seizures.

Lennox-Gastaut syndrome

A tertiary specialist should be involved in decisions regarding treatment of Lennox-Gastaut syndrome. Sodium valproate is the first-line drug for treating Lennox-Gastaut syndrome (except in pregnancy or females of childbearing potential, see *Valproate* below); lamotrigine can be used as adjunctive treatment if sodium valproate is unsuitable, ineffective or not tolerated. If adjunctive treatment is ineffective or not tolerated, rufinamide p. 232 and topiramate p. 238 may be considered by tertiary specialists. Felbamate [unlicensed] may be used in tertiary specialist centres when sodium valproate, lamotrigine, rufinamide, and topiramate treatment options have failed or are not tolerated. Cannabidiol with clobazam may also be an appropriate treatment option in certain children. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine, and vigabatrin should not be used.

Landau-Kleffner syndrome

Always discuss with or refer to tertiary epilepsy specialists.

Neonatal seizures

Seizures can occur before delivery, but they are most common up to 24 hours after birth. Seizures in neonates occur as a result of biochemical disturbances, inborn errors of metabolism, hypoxic ischaemic encephalopathy, drug withdrawal, meningitis, stroke, cerebral haemorrhage or malformation, or severe jaundice (kernicterus).

Seizures caused by biochemical imbalance and those in neonates with inherited abnormal pyridoxine or biotin metabolism should be corrected by treating the underlying cause. Seizures caused by drug withdrawal following intrauterine exposure are treated with a drug withdrawal regimen.

Phenobarbital p. 243 can be used to manage neonatal seizures where there is a risk of recurrence; phenytoin is an alternative. Midazolam p. 251 and **rectal** paraldehyde p. 248 may also be useful in the management of acute neonatal seizures. Lidocaine hydrochloride p. 937 may be used if other treatments are unsuccessful; lidocaine hydrochloride should not be given to neonates who have received phenytoin infusion because of the risk of cardiac toxicity.

Antiepileptic drugs

Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly in small increments every 3–7 days. Carbamazepine may exacerbate tonic, atonic, myoclonic, and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine is not recommended in tonic, atonic, absence, or myoclonic seizures due to the risk of seizure exacerbation.

Ethosuximide
Ethosuximide is a first-line treatment option for absence seizures, and may be used as adjunctive treatment when monotherapy has failed.

Gabapentin
Gabapentin is used as adjunctive therapy for the treatment of focal seizures with or without secondary generalisation; it is licensed as monotherapy in children over 12 years. It is not recommended if tonic, atonic, absence, or myoclonic seizures are present.

Lamotrigine
Lamotrigine is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed as monotherapy for typical absence seizures in children (but efficacy may not be maintained in all children). It may be tried as an adjunctive treatment for atonic and tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

Levetiracetam and brivaracetam
Levetiracetam p. 227 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in children with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Brivaracetam p. 216 is used as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation.

Phenobarbital and primidone
Phenobarbital is effective for tonic-clonic, focal seizures and neonatal seizures but may cause behavioural disturbances and hyperkinesia. It may be tried for atypical absence, atonic, and tonic seizures. For therapeutic purposes phenobarbital and *phenobarbital sodium* should be considered equivalent in effect. Rebound seizures may be a problem on withdrawal.

Primidone p. 244 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. It is used rarely in children. A low initial dose of primidone is essential.

Phenytoin
Phenytoin is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if theses seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 222, a pro-drug of phenytoin, may be convenient to give. Whereas phenytoin should be given intravenously only, fosphenytoin sodium may also be given by intramuscular injection.

Rufinamide
Rufinamide is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

Topiramate
Topiramate can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures. It can also be used for absence, tonic, and atonic seizures under specialist supervision and as an option in myoclonic seizures [all unlicensed].

Valproate
Valproate (as either sodium valproate or valproic acid p. 239) is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences, and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Valproate should generally be avoided in children under 2 years especially with other antiepileptics, but it may be required in infants with continuing epileptic tendency. Sodium valproate p. 233 has widespread metabolic effects, and monitoring of liver function tests and full blood count is essential. Because of its high teratogenic potential, valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. During pregnancy, it must not be used for epilepsy unless it is the only possible treatment. For further information see *Important safety information*, *Conception and contraception*, and *Pregnancy* in the sodium valproate and valproic acid p. 239 drug monographs. Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

Zonisamide
Zonisamide p. 242 can be used as an adjunctive treatment for refractory focal seizures with or without secondary generalisation in children and adolescents aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines
Clobazam p. 246 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 247 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs
Acetazolamide p. 775, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam is used as adjunctive treatment for cortical myoclonus.

Status epilepticus

Convulsive status epilepticus
Immediate measures to manage status epilepticus include positioning the child to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Pyridoxine hydrochloride p. 716 should be administered if the status epilepticus is caused by pyridoxine deficiency.

Seizures lasting 5 minutes should be treated urgently with buccal midazolam p. 251 or intravenous lorazepam p. 250 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 249 is effective but it carries a high risk of venous thrombophlebitis (reduced by using an emulsion formulation of diazepam injection).

Patients should be monitored for respiratory depression and hypotension.

Important

If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium should be used, or if the child is on regular phenytoin p. 230, give phenobarbital sodium intravenously over 5 minutes; the paediatric intensive care unit should be contacted. Paraldehyde p. 248 can be given after starting phenytoin infusion.

If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 248 should be instituted with full intensive care support.

Phenytoin sodium can be given by intravenous infusion over 20 minutes, followed by the maintenance dosage if appropriate.

Paraldehyde given rectally causes little respiratory depression and is therefore useful where facilities for resuscitation are poor.

Non-convulsive status epilepticus

The urgency to treat non-convulsive status epilepticus depends on the severity of the child's condition. If there is incomplete loss of awareness, oral antiepileptic therapy should be continued or restarted. Children who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

Febrile convulsions

Brief febrile convulsions need no specific treatment. *Prolonged febrile convulsions* (those lasting 5 minutes or longer), or *recurrent febrile convulsions* without recovery must be treated actively (as for convulsive status epilepticus).

Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

ANTIEPILEPTICS

Brivaracetam

05-Feb-2021

- **INDICATIONS AND DOSE**

Adjunctive therapy of focal seizures with or without secondary generalisation

- BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child 4–17 years (body-weight up to 50 kg): Initially 0.5–1 mg/kg twice daily, adjusted according to response; usual maintenance 1 mg/kg twice daily (max. per dose 2 mg/kg twice daily)
- Child 4–17 years (body-weight 50 kg and above): Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 50 mg twice daily (max. per dose 100 mg twice daily)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite decreased · constipation · cough · depression · dizziness · drowsiness · fatigue · increased risk of infection · insomnia · irritability · nausea · vertigo · vomiting
  - **Uncommon** Aggression · psychotic disorder
  - **Frequency not known** Suicidal behaviours
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available. See also *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

  Dose adjustments Manufacturer advises initial dose of 25 mg twice daily, max. maintenance dose of 75 mg twice daily in children body-weight 50 kg and above.

  Manufacturer advises initial dose of 0.5 mg/kg twice daily, max. maintenance dose of 1.5 mg/kg twice daily in children with body-weight up to 50 kg (no information available).
- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal—reduce daily dose in steps of 50 mg at weekly intervals, then reduce to 20 mg daily for a final week.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intermittent *intravenous infusion*, manufacturer advises dilute in Glucose 5% *or* Sodium Chloride 0.9% *or* Lactated Ringer's solution; give over 15 minutes.
  - With oral use Manufacturer advises oral solution can be diluted in water or juice shortly before swallowing.
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises if switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the total daily dose and the frequency of administration should be maintained.
- **PATIENT AND CARER ADVICE**

  Missed doses Manufacturer advises if one or more doses are missed, a single dose should be taken as soon as possible and the next dose should be taken at the usual time.

  Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

Cannabidiol

28-Feb-2022

- **INDICATIONS AND DOSE**

Seizures associated with Lennox-Gastaut syndrome [adjunctive treatment with clobazam] (specialist use only) | Seizures associated with Dravet syndrome [adjunctive treatment with clobazam] (specialist use only)

- BY MOUTH
- Child 2–17 years: Initially 2.5 mg/kg twice daily for 1 week, then increased to 5 mg/kg twice daily, then increased in steps of 2.5 mg/kg twice daily if required, dose to be adjusted according to response at weekly intervals, food may affect absorption (take at the same time with respect to food); maximum 20 mg/kg per day

Seizures associated with tuberous sclerosis complex [adjunctive treatment] (specialist use only)

- BY MOUTH
- Child 2–17 years: Initially 2.5 mg/kg twice daily for 1 week, then increased to 5 mg/kg twice daily, then increased in steps of 2.5 mg/kg twice daily if required, dose to be adjusted according to response at weekly intervals, food may affect absorption (take at the same time with respect to food); maximum 25 mg/kg per day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)
See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)
See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)
See Epilepsy p. 211.

- **INTERACTIONS** → Appendix 1: cannabidiol
- **SIDE-EFFECTS**
- **Common or very common** Aggression · appetite decreased · cough · diarrhoea · drowsiness · fatigue · fever · increased risk of infection · irritability · nausea · rash · seizure · vomiting · weight decreased
- **Frequency not known** Anaemia · suicidal behaviours
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** Manufacturer advises avoid—limited information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).
  Dose adjustments Manufacturer advises dose reduction in moderate to severe impairment—consult product literature.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function at baseline, at 1 month, 3 months, and 6 months of treatment, then periodically thereafter; more frequent monitoring is recommended in patients with raised baseline ALT or AST or taking valproate. Restart monitoring schedule if dose increased above 10 mg/kg/day. If transaminase or bilirubin levels increase significantly or symptoms of hepatic dysfunction occur, treatment should be withheld or permanently discontinued based on severity—consult product literature.
- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal—withdraw treatment gradually.
- **DIRECTIONS FOR ADMINISTRATION** For administration advice via nasogastric or gastrostomy tube—consult product literature.
- **PATIENT AND CARER ADVICE** Oral solution should be discarded 12 weeks after first opening.
  Missed doses If doses are missed for more than 7 days, dose titration should be re-started.
  Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of somnolence and sedation. Effects of alcohol increased.
  For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and driving under Guidance on prescribing p. 1.
- **NATIONAL FUNDING/ACCESS DECISIONS**

  Cannabidiol 100 mg per 1 ml Epidyolex 100mg/ml oral solution sugar-free | 100 ml PoM CD5

Carbamazepine

26-Oct-2021

INDICATIONS AND DOSE

Trigeminal neuralgia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month-11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- Child 12-17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Prophylaxis of bipolar disorder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month-11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- Child 12-17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Focal and generalised tonic-clonic seizures

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month-11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- Child 12-17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

BY RECTUM

- Child: Up to 250 mg up to 4 times a day, to be used for short-term use (max. 7 days) when oral therapy temporarily not possible, use approx. 25% more than the oral dose

DOSE EQUIVALENCE AND CONVERSION

- Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CARBAGEN ® SR

Trigeminal neuralgia

BY MOUTH

- Child 5-11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
- Child 12-17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

BY MOUTH

- Child 5-11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required, dose should be increased slowly; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
- Child 12-17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

TEGRETOL ® PROLONGED RELEASE

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

BY MOUTH

- Child 5-11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses
- Child 12-17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses

Trigeminal neuralgia

BY MOUTH

- Child 5-11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses
- Child 12-17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses, dose should be increased slowly

UNLICENSED USE Not licensed for use in trigeminal neuralgia or prophylaxis of bipolar disorder.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

CONTRA-INDICATIONS Acute porphyrias p. 688 · AV conduction abnormalities (unless paced) · history of bone-marrow depression

CAUTIONS Cardiac disease · history of haematological reactions to other drugs · may exacerbate absence and myoclonic seizures · skin reactions · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- Blood, hepatic, or skin disorders Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

INTERACTIONS → Appendix 1: antiepileptics

SIDE-EFFECTS

- **Common or very common** Dizziness · drowsiness · dry mouth · eosinophilia · fatigue · fluid imbalance ·

gastrointestinal discomfort · headache · hyponatraemia · leucopenia · movement disorders · nausea · oedema · skin reactions · thrombocytopenia · vision disorders · vomiting · weight increased

- **Uncommon** Constipation · diarrhoea · eye disorders · tic · tremor
- **Rare or very rare** Aggression · agranulocytosis · albuminuria · alopecia · anaemia · angioedema · anxiety · appetite decreased · arrhythmias · arthralgia · azotaemia · bone disorders · bone marrow disorders · cardiac conduction disorders · circulatory collapse · confusion · congestive heart failure · conjunctivitis · coronary artery disease aggravated · depression · dyspnoea · embolism and thrombosis · erythema nodosum · fever · folate deficiency · galactorrhoea · gynaecomastia · haematuria · haemolytic anaemia · hallucinations · hearing impairment · hepatic disorders · hirsutism · hyperacusia · hyperhidrosis · hypersensitivity · hypertension · hypogammaglobulinaemia · hypotension · lens opacity · leucocytosis · lymphadenopathy · meningitis aseptic · muscle complaints · muscle weakness · nephritis tubulointerstitial · nervous system disorder · neuroleptic malignant syndrome · oral disorders · pancreatitis · paraesthesia · paresis · peripheral neuropathy · photosensitivity reaction · pneumonia · pneumonitis · pseudolymphoma · psychosis · red blood cell abnormalities · renal impairment · severe cutaneous adverse reactions (SCARs) · sexual dysfunction · speech impairment · spermatogenesis abnormal · syncope · systemic lupus erythematosus (SLE) · taste altered · tinnitus · urinary disorders · vanishing bile duct syndrome · vasculitis
- **Frequency not known** Bone fracture · colitis · human herpesvirus 6 infection reactivation · memory loss · nail loss · suicidal behaviours

SIDE-EFFECTS, FURTHER INFORMATION Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment.

Overdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 944.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 211 for more information. EvGr Caution—cross-sensitivity reported with oxcarbazepine, phenytoin, primidone, and phenobarbital. M
- **PREGNANCY** An increased risk of major congenital malformations has been seen with carbamazepine, see *Pregnancy* in Epilepsy p. 211 for further details.
  Monitoring EvGr Plasma-drug concentration should be monitored and may be maintained on the lower side of the therapeutic range provided seizure control is maintained. M
- **BREAST FEEDING** Amount probably too small to be harmful.
  Monitoring Monitor infant for possible adverse reactions.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution and close monitoring—no information available.
- **RENAL IMPAIRMENT** EvGr Use with caution. M
- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).
- **MONITORING REQUIREMENTS**
  - Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.
  - Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).
- **TREATMENT CESSATION** When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.
- **DIRECTIONS FOR ADMINISTRATION** Expert sources advise oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).

  TEGRETOL® PROLONGED RELEASE Manufacturer advises *Tegretol® Prolonged Release* tablets can be halved but should not be chewed.
- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.
- **PATIENT AND CARER ADVICE**
  Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.
  Medicines for Children leaflet: Carbamazepine (oral) for preventing seizures www.medicinesforchildren.org.uk/medicines/carbamazepine-oral-for-preventing-seizures/
- **PROFESSION SPECIFIC INFORMATION**
  Dental practitioners' formulary Carbamazepine Tablets may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CONTRA-INDICATIONS** Second- or third-degree AV block
- **CAUTIONS** Hyponatraemia · PR-interval prolongation
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite decreased · asthenia · concentration impaired · diarrhoea · dizziness · drowsiness · gait abnormal · gastrointestinal discomfort · headaches · movement disorders · nausea · skin reactions · sleep disorders · vertigo · vision disorders · vomiting
  - **Uncommon** Alopecia · anaemia · bradycardia · chest pain · chills · confusion · constipation · depression · dry mouth · electrolyte imbalance · eye disorders · flushing · gastritis · haemorrhage · hearing impairment · hyperhidrosis · hypertension · hypotension · hypothyroidism · increased risk of infection · liver disorder · malaise · mood altered · muscle weakness · myalgia · pain in extremity · palpitations · peripheral coldness · peripheral neuropathy · peripheral oedema · psychomotor retardation · psychotic disorder · sensation abnormal · speech impairment · tinnitus · toothache · weight decreased
  - **Frequency not known** Angioedema · leucopenia · pancreatitis · severe cutaneous adverse reactions (SCARs) · suicidal behaviours · thrombocytopenia
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 211 for more information.
- **PREGNANCY** EvGr Caution—reproductive toxicity in *animal* studies. Ⓜ See also *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment—limited information; avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.

  Dose adjustments See p. 15.

  Manufacturer advises *child* 6–17 *years (body-weight up to* 60 *kg)*, reduce initial dose to 5 mg/kg once daily or 10 mg/kg every other day for 2 weeks, then increase to 10 mg/kg once daily if creatinine clearance 30–60 mL/minute. The dose may be further increased based on individual response.

  Manufacturer advises *child* 6–17 *years (body-weight* 60 *kg and above)*, reduce initial dose to 200 mg once daily or 400 mg every other day for 2 weeks, then increase to 400 mg once daily if creatinine clearance 30–60 mL/minute. The dose may be further increased based on individual response.
- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative— risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).
- **MONITORING REQUIREMENTS** Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.
- **PRESCRIBING AND DISPENSING INFORMATION**

  Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- **PATIENT AND CARER ADVICE**

  Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, somnolence and visual disorders.
- **NATIONAL FUNDING/ACCESS DECISIONS**

  For full details see funding body website

  Scottish Medicines Consortium (SMC) decisions
  - **Eslicarbazepine acetate (*Zebinix*®) for adjunctive therapy in adolescents and children aged above 6 years with partial-onset seizures with or without secondary generalisation (February 2019)** SMC No. SMC2087 Recommended with restrictions

  All Wales Medicines Strategy Group (AWMSG) decisions
  - **Eslicarbazepine acetate (*Zebinix*®) as adjunctive therapy in adults, adolescents and children aged above six years, with partial-onset seizures with or without secondary generalisation (June 2019)** AWMSG No. 1214 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 8

Ethosuximide

26-Oct-2021

INDICATIONS AND DOSE

Absence seizures | Atypical absence seizures (adjunct) | Myoclonic seizures

- BY MOUTH
- Child 1 month–5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses
- Child 6–17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CAUTIONS** Avoid in Acute porphyrias p. 688
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS** Aggression · agranulocytosis · appetite decreased · blood disorder · bone marrow disorders · concentration impaired · depression · diarrhoea · dizziness · drowsiness · erythema nodosum · fatigue · gastrointestinal discomfort · generalised tonic-clonic seizure · headache · hiccups · leucopenia · libido increased · lupus-like syndrome · mood altered · movement disorders · nausea · nephrotic syndrome · oral disorders · psychosis · rash · sleep disorders · Stevens-Johnson syndrome · suicidal behaviours · vaginal haemorrhage · vision disorders · vomiting · weight decreased

  SIDE-EFFECTS, FURTHER INFORMATION Blood counts required if features of fever, sore throat, mouth ulcers, bruising or bleeding.
- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 211.

  Monitoring EvGr Plasma-drug concentration should be regularly monitored during pregnancy; lowest effective dose must not be exceeded. M
- **BREAST FEEDING** Present in milk. Hyperexcitability and sedation reported.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** EvGr Use with caution—monitor drug concentration. M
- **PATIENT AND CARER ADVICE**

  Blood disorders Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 8

- **Ethosuximide (Non-proprietary)**

  Ethosuximide 50 mg per 1 ml Ethosuximide 250mg/5ml syrup | 200 ml PoM £173.00 DT = £173.00

  Ethosuximide 250mg/5ml oral solution sugar free sugar-free | 125 ml PoM £108.13–£119.84 sugar-free | 200 ml PoM £173.00–£218.49 sugar-free | 250 ml PoM £239.68 DT = £239.68
- **Emeside** (Fontus Health Ltd)

  Ethosuximide 50 mg per 1 ml Emeside 250mg/5ml syrup | 200 ml PoM £91.43 DT = £173.00

Capsule

CAUTIONARY AND ADVISORY LABELS 8

- **Ethosuximide (Non-proprietary)**

  Ethosuximide 250 mg Ethosuximide 250mg capsules | 56 capsule PoM £194.27 DT = £194.27
- **Emeside** (Fontus Health Ltd)

  Ethosuximide 250 mg Emeside 250mg capsules | 56 capsule PoM £100.42 DT = £194.27
- **Epesri** (Strides Pharma UK Ltd)

  Ethosuximide 250 mg Epesri 250mg capsules | 56 capsule PoM £100.41 DT = £194.27

Fenfluramine

30-Jul-2021

- **DRUG ACTION** Fenfluramine is a serotonin-releasing agent that stimulates multiple 5-HT receptor subtypes; this action on serotonin receptors in the brain may contribute to its anti-seizure activity.

INDICATIONS AND DOSE

Adjunctive therapy of seizures associated with Dravet syndrome (specialist use only)

- BY MOUTH
- Child 2–17 years: Initially 0.1 mg/kg twice daily for 1 week, then increased if necessary to 0.2 mg/kg twice daily for 1 week, adjusted according to response; maintenance 0.35 mg/kg twice daily, for patients requiring more rapid titration, the dose may be increased every 4 days; maximum 26 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- When used with stiripentol, a lower maintenance dose of 0.2 mg/kg twice daily is recommended; maximum 17 mg per day.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CONTRA-INDICATIONS** Pulmonary arterial hypertension · valvular heart disease (aortic or mitral)
- **CAUTIONS** History of anorexia nervosa · history of bulimia nervosa
- **INTERACTIONS** → Appendix 1: fenfluramine
- **SIDE-EFFECTS**
- **Common or very common** Appetite decreased · behaviour abnormal · constipation · diarrhoea · drowsiness · fall · fatigue · fever · increased risk of infection · irritability · status epilepticus · tremor · vomiting · weight decreased
- **Frequency not known** Angle closure glaucoma · mydriasis
- **PREGNANCY** EvGr Avoid—limited information available. M See also *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** EvGr Avoid—present in milk in *animal* studies. M
- **HEPATIC IMPAIRMENT** EvGr Avoid in moderate or severe impairment (no information available). M
- **MONITORING REQUIREMENTS**
- EvGr An echocardiogram should be performed before starting treatment, then every 6 months for the first 2 years, and annually thereafter; if pathological valvular

changes or pulmonary arterial hypertension develop, a follow-up echocardiogram should be performed at an earlier timeframe—consult product literature.

- Monitor body-weight during treatment. Ⓜ

- **PRESCRIBING AND DISPENSING INFORMATION** *Fintepla*® should be prescribed and dispensed according to the controlled access programme.

  The manufacturer has provided a *Prescriber Guide*.

- **PATIENT AND CARER ADVICE** The manufacturer of *Fintepla*® has provided a *Patient and Caregiver Guide*.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 2, 8

EXCIPIENTS: May contain Glucose, hydroxybenzoates (parabens)

- **Fintepla** (Zogenix International Ltd) ▼

  Fenfluramine (as Fenfluramine hydrochloride) 2.2 mg per 1 ml Fintepla 2.2mg/ml oral solution sugar-free | 120 ml PoM £1,802.88 (Hospital only) sugar-free | 360 ml PoM £5,408.65 (Hospital only)

Fosphenytoin sodium

10-May-2021

- **DRUG ACTION** Fosphenytoin is a pro-drug of phenytoin.

- **INDICATIONS AND DOSE**

Status epilepticus

- BY INTRAVENOUS INFUSION
- Child 5–17 years: Initially 20 mg(PE)/kg, dose to be administered at a rate of 2–3 mg(PE)/kg/minute, maximum 150 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–4 divided doses, dose to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg (PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration

Prophylaxis or treatment of seizures associated with neurosurgery or head injury

- BY INTRAVENOUS INFUSION
- Child 5–17 years: Initially 10–15 mg(PE)/kg, then 4–5 mg(PE)/kg daily in 1–4 divided doses, dose to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration

Temporary substitution for oral phenytoin

- BY INTRAVENOUS INFUSION
- Child 5–17 years: Same dose and same dosing frequency as oral phenytoin therapy, intravenous infusion to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg(PE)/minute

DOSE EQUIVALENCE AND CONVERSION

- Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg ≡ phenytoin sodium 1 mg.

- **UNLICENSED USE** Fosphenytoin sodium doses in BNF for Children may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · second-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome · third-degree heart block

- **CAUTIONS** Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS**

- **Common or very common** Asthenia · chills · dizziness · drowsiness · dry mouth · dysarthria · euphoric mood · headache · hypotension · movement disorders · nausea · nystagmus · sensation abnormal · skin reactions · stupor · taste altered · tinnitus · tremor · vasodilation · vertigo · vision disorders · vomiting

- **Uncommon** Cardiac arrest · confusion · hearing impairment · muscle complaints · muscle weakness · nervousness · oral disorders · reflexes abnormal · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thinking abnormal

- **Frequency not known** Acute psychosis · agranulocytosis · appetite disorder · atrial conduction depression (more common if injection too rapid) · atrioventricular block · bone disorders · bone fracture · bone marrow disorders · bradycardia · cardiotoxicity · cerebrovascular insufficiency · circulatory collapse (more common if injection too rapid) · coarsening of the facial features · constipation · delirium · Dupuytren's contracture · encephalopathy · granulocytopenia · groin tingling · hair changes · hepatic disorders · hyperglycaemia · hypersensitivity · insomnia · leucopenia · lymphadenopathy · nephritis tubulointerstitial · Peyronie's disease · polyarteritis nodosa · polyarthritis · purple glove syndrome · respiratory disorders · sensory peripheral polyneuropathy · suicidal behaviours · thrombocytopenia · tonic seizure · ventricular conduction depression (more common if injection too rapid) · ventricular fibrillation (more common if injection too rapid)

  SIDE-EFFECTS, FURTHER INFORMATION Fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended: monitor heart rate, blood pressure, and respiratory function for duration of infusion; observe patient for at least 30 minutes after infusion; if hypotension occurs, reduce infusion rate or discontinue; reduce dose or infusion rate in renal or hepatic impairment.

- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine.

- **PREGNANCY** An increased risk of major congenital malformations and possibility of adverse effects on neurodevelopment have been seen with phenytoin, see *Pregnancy* in Epilepsy p. 211.

  Monitoring Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction.

  EvGr Doses should be adjusted on the basis of plasma-drug concentration monitoring—phenytoin pharmacokinetics altered during pregnancy. Ⓜ

- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor free plasma-phenytoin concentration (rather than total plasma-phenytoin concentration) in hepatic impairment or hypoalbuminaemia and in hyperbilirubinaemia.

  Dose adjustments Manufacturer advises consider a 10–25% reduction in dose or infusion rate (except in the treatment of status epilepticus) in hepatic impairment or hypoalbuminaemia.

- **RENAL IMPAIRMENT** EvGr Caution—monitor free plasma-phenytoin concentration (rather than total plasma-phenytoin concentration) in renal impairment or hypoalbuminaemia. Ⓜ
  Dose adjustments EvGr Consider a 10–25% reduction in dose or infusion rate (except in the treatment of status epilepticus) in renal impairment or hypoalbuminaemia. Ⓜ
- **PRE-TREATMENT SCREENING** HLA-B* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).
- **MONITORING REQUIREMENTS**
  - Manufacturer recommends blood counts (but evidence of practical value uncertain).
  - With intravenous use Monitor heart rate, blood pressure, ECG, and respiratory function for during infusion.
- **DIRECTIONS FOR ADMINISTRATION** For *intermittent intravenous infusion* (*Pro-Epanutin*®), manufacturer advises give *in* Glucose 5% *or* Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg ≡ phenytoin sodium 1 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Phosphate

- **Pro-Epanutin** (Pfizer Ltd)
  Fosphenytoin sodium 75 mg per 1 ml Pro-Epanutin 750mg/10ml concentrate for solution for injection vials | 10 vial PoM £400.00 (Hospital only)

Gabapentin

10-Nov-2021

- **INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalisation

- BY MOUTH
  - Child 2-5 years: 10 mg/kg once daily on day 1, then 10 mg/kg twice daily on day 2, then 10 mg/kg 3 times a day on day 3, then increased to 30–70 mg/kg daily in 3 divided doses, adjusted according to response, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
  - Child 6-11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day
  - Child 12-17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

Monotherapy for focal seizures with or without secondary generalisation

- BY MOUTH
  - Child 12-17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

- **UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed at doses over 50 mg/kg daily in children under 12 years.

IMPORTANT SAFETY INFORMATION

The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature.

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: GABAPENTIN (*NEURONTIN*®): RISK OF SEVERE RESPIRATORY DEPRESSION (OCTOBER 2017)

Gabapentin has been associated with a rare risk of severe respiratory depression even without concomitant opioid medicines. Patients with compromised respiratory function, respiratory or neurological disease, renal impairment, and concomitant use of central nervous system (CNS) depressants might be at higher risk of experiencing severe respiratory depression and dose adjustments may be necessary in these patients.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211.

MHRA/CHM ADVICE: GABAPENTIN (*NEURONTIN*®) AND RISK OF ABUSE AND DEPENDENCE: NEW SCHEDULING REQUIREMENTS FROM 1 APRIL (APRIL 2019)

Following concerns about abuse, gabapentin has been reclassified as a Class C controlled substance and is now a Schedule 3 drug, but is exempt from safe custody requirements. Healthcare professionals should evaluate patients carefully for a history of drug abuse before prescribing gabapentin, and observe patients for signs of abuse and dependence. Patients should be informed of the potentially fatal risks of interactions between gabapentin and alcohol, and with other medicines that cause CNS depression, particularly opioids.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CAUTIONS** Diabetes mellitus · high doses of oral solution in adolescents and adults with low body-weight · history of substance abuse · mixed seizures (including absences) · respiratory depression, see *Important safety information*
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite abnormal · arthralgia · asthenia · behaviour abnormal · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysarthria · dyspnoea · emotional lability · fever · flatulence · gait abnormal · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · leucopenia · malaise · memory loss · movement disorders · muscle complaints · nausea · nystagmus · oedema · pain · reflexes abnormal · sensation abnormal · sexual dysfunction · skin reactions · thinking abnormal · tooth disorder · tremor · vasodilation · vertigo · visual impairment · vomiting

- **Uncommon** Cognitive impairment · dysphagia · palpitations
- **Rare or very rare** Respiratory depression
- **Frequency not known** Acute kidney injury · alopecia · angioedema · breast enlargement · drug use disorders · gynaecomastia · hallucination · hepatic disorders · hyponatraemia · pancreatitis · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · suicidal behaviours · thrombocytopenia · tinnitus · urinary incontinence · withdrawal syndrome

- **PREGNANCY** Manufacturer advises avoid unless benefit outweighs risk — toxicity reported. See also *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk. See also *Breast-feeding* in Epilepsy p. 211.
- **RENAL IMPAIRMENT**
  Dose adjustments See p. 15. Manufacturer advises reduce dose if creatinine clearance less than 80 mL/minute (consult product literature).
- **MONITORING REQUIREMENTS** Monitor for signs of gabapentin abuse.
- **EFFECT ON LABORATORY TESTS** False positive readings with some urinary protein tests.
- **DIRECTIONS FOR ADMINISTRATION** Expert sources advise capsules can be opened but the bitter taste is difficult to mask.

Lacosamide

10-Nov-2021

- **INDICATIONS AND DOSE**

Monotherapy of focal seizures with or without secondary generalisation

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child (body-weight 50 kg and above): Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week, alternatively initially 100 mg twice daily; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
- Child 4–17 years (body-weight up to 50 kg): (consult product literature)

Monotherapy of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child (body-weight 50 kg and above): Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

Adjunctive treatment of focal seizures with or without secondary generalisation

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child (body-weight 50 kg and above): Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
- Child 4–17 years (body-weight up to 50 kg): (consult product literature)

Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child (body-weight 50 kg and above): Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

Lamotrigine

10-Nov-2021

- **INDICATIONS AND DOSE**

Monotherapy of focal seizures | Monotherapy of primary and secondary generalised tonic-clonic seizures | Monotherapy of seizures associated with Lennox-Gastaut syndrome

- BY MOUTH
- Child 12–17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Monotherapy of typical absence seizures

- BY MOUTH
- Child 2–11 years: Initially 300 micrograms/kg daily in 1–2 divided doses, for 14 days, then 600 micrograms/kg daily in 1–2 divided doses, for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, increased if necessary up to 15 mg/kg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures with valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate

- BY MOUTH
- Child 2–11 years (body-weight up to 13 kg): Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- Child 2–11 years (body-weight 13 kg and above): Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- Child 12–17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days continued →

Adjunctive therapy of focal seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate

- BY MOUTH
- Child 2–11 years: Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7–14 days; maintenance 5–15 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day
- Child 12–17 years: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate

- BY MOUTH
- Child 2–11 years: Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- Child 12–17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)
See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)
See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)
See Epilepsy p. 211.

- **CAUTIONS** Brugada syndrome · myoclonic seizures (may be exacerbated)
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
- **Common or very common** Aggression · agitation · arthralgia · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · headache · irritability · nausea · pain · rash · sleep disorders · tremor · vomiting
- **Uncommon** Alopecia · movement disorders · vision disorders
- **Rare or very rare** Confusion · conjunctivitis · disseminated intravascular coagulation · face oedema · fever · haemophagocytic lymphohistiocytosis · hallucination · hepatic disorders · lupus-like syndrome · lymphadenopathy · meningitis aseptic · multi organ failure · nystagmus · seizure · severe cutaneous adverse reactions (SCARs) · tic
- **Frequency not known** Suicidal behaviours

SIDE-EFFECTS, FURTHER INFORMATION Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed; most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 211 for more information.
- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 211.
Monitoring EvGr Plasma-drug concentration should be monitored before, during, and after pregnancy, including shortly after birth, and doses adjusted according to response—plasma levels alter during pregnancy and may increase rapidly after birth. M
- **BREAST FEEDING** Present in milk, but limited data suggest no harmful effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.
Dose adjustments Manufacturer advises dose reduction of approx. 50% in moderate impairment, and approx. 75% in severe impairment; adjust according to response.
- **RENAL IMPAIRMENT** EvGr Caution in renal failure; metabolite may accumulate. M
Dose adjustments EvGr Consider reducing maintenance dose in significant impairment. M
- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic lamotrigine product.
Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- **PATIENT AND CARER ADVICE**
Skin reactions Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop.
Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.
Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/medicines/lamotrigine-for-preventing-seizures/

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Dispersible tablet

Levetiracetam

22-Mar-2022

- **INDICATIONS AND DOSE**

Monotherapy of focal seizures with or without secondary generalisation

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child 16–17 years: Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

Adjunctive therapy of focal seizures with or without secondary generalisation

- BY MOUTH
- Child 1–5 months: Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
- Child 6 months–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks
- BY INTRAVENOUS INFUSION
- Child 4–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

Adjunctive therapy of myoclonic seizures and tonic-clonic seizures

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child 12–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

Convulsive status epilepticus (administered on expert advice)

- BY INTRAVENOUS INFUSION
- Child: 40 mg/kg (max. per dose 3 g) as a single dose; consult local protocols

- **UNLICENSED USE** EvGr Initial dosing recommendations for levetiracetam Ⓔ in BNF Publications differ from product licence.
  - With intravenous use EvGr Levetiracetam is used for the treatment of convulsive status epilepticus, Ⓐ but is not licensed for this indication.
  - With oral use Manufacturer advises *granules* not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg—oral solution should be used.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CAUTIONS** Risk factors for QT interval prolongation
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite decreased · asthenia · behaviour abnormal · cough · depression · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · headache · increased risk of infection · insomnia · mood altered · movement disorders · nausea · skin reactions · tremor · vertigo · vomiting
  - **Uncommon** Alopecia · concentration impaired · confusion · hallucination · leucopenia · memory impairment · muscle weakness · myalgia · paraesthesia · psychotic disorder · suicidal behaviours · thrombocytopenia · vision disorders · weight changes
  - **Rare or very rare** Acute kidney injury · agranulocytosis · bone marrow disorders · delirium · encephalopathy · gait abnormal · hepatic disorders · hyponatraemia · neutropenia · pancreatitis · personality disorder · QT interval prolongation · rhabdomyolysis · seizures exacerbated · severe cutaneous adverse reactions (SCARs) · thinking abnormal
  - **Frequency not known** Neuroleptic malignant syndrome
- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 211.
  Monitoring EvGr Clinical response should be monitored during pregnancy—plasma concentrations decrease during pregnancy (by up to 60% in the third trimester). Ⓜ

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
  Dose adjustments Manufacturer advises maintenance dose reduction of 50% in severe impairment if creatinine clearance is less than 60 mL/minute/1.73 m^2—consult product literature.
- **RENAL IMPAIRMENT**
  Dose adjustments Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m^2 (consult product literature).
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use for focal seizures, myoclonic seizures, or tonic-clonic seizures EvGr Dilute calculated dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9%; give over 15 minutes. M
  - With intravenous use for convulsive status epilepticus EvGr Dilute calculated dose with Glucose 5% or Sodium Chloride 0.9% to a concentration of 50 mg/mL and give over 5 minutes. A
  - With oral use For administration of *oral solution*, manufacturer advises dose may be diluted in a glass of water.
- **PRESCRIBING AND DISPENSING INFORMATION** If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.
- **PATIENT AND CARER ADVICE** Patients and caregivers should be advised to seek medical advice if signs of depression or suicidal ideation emerge. Patients should consult their doctor immediately if seizures worsen.
  Medicines for Children leaflet: Levetiracetam for preventing seizures www.medicinesforchildren.org.uk/medicines/levetiracetam-for-preventing-seizures/
  Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of somnolence or other CNS side-effects.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Granules

CAUTIONARY AND ADVISORY LABELS 3, 8

Oxcarbazepine

10-Nov-2021

- **INDICATIONS AND DOSE**

Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

- BY MOUTH
- Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day

Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

- BY MOUTH
- Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CAUTIONS** Avoid in Acute porphyrias p. 688 · cardiac conduction disorders · heart failure · hyponatraemia · may exacerbate absence and myoclonic seizures
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · agitation · alopecia · asthenia · ataxia · concentration impaired · constipation · depression · diarrhoea · dizziness ·

drowsiness · emotional lability · headache · hyponatraemia · nausea · nystagmus · skin reactions · vertigo · vision disorders · vomiting

- **Uncommon** Leucopenia
- **Rare or very rare** Angioedema · arrhythmia · atrioventricular block · hepatitis · hypothyroidism · pancreatitis · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia
- **Frequency not known** Agranulocytosis · bone disorders · bone marrow disorders · hypertension · inappropriate antidiuretic hormone secretion like-syndrome · neutropenia · speech impairment · suicidal behaviours

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 211 for more information.
- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 211.
  Monitoring EvGr Clinical response should be monitored carefully during pregnancy, and plasma concentration monitoring of the active metabolite should be considered during and after pregnancy (if doses were increased during pregnancy)—plasma levels of the active metabolite may gradually decrease during pregnancy. M
- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT**
  Dose adjustments EvGr Halve initial dose if creatinine clearance less than 30 mL/minute; increase according to response at intervals of at least 1 week. M See p. 15.
- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).
- **MONITORING REQUIREMENTS**
  - Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
  - Monitor body-weight in patients with heart failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Patients may need to be maintained on a specific manufacturer's branded or generic oxcarbazepine product.
  Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- **PATIENT AND CARER ADVICE**
  Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.
  Medicines for Children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/medicines/oxcarbazepine-for-preventing-seizures/

Perampanel

22-Jun-2021

- **INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalised seizures

- BY MOUTH
- Child 4–11 years (body-weight up to 20 kg): Initially 1 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 1 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 2–4 mg once daily, then increased, if tolerated, in steps of 0.5 mg at intervals of at least every 2 weeks, adjusted according to response; maximum 6 mg per day
- Child 4–11 years (body-weight 20–29 kg): Initially 1 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 1 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–6 mg once daily; maximum 8 mg per day
- Child 4–11 years (body-weight 30 kg and above): Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
- Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day

Adjunctive treatment of primary generalised tonic-clonic seizures

- BY MOUTH
- Child 7–11 years (body-weight up to 20 kg): Initially 1 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 1 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 2–4 mg once daily, then increased, if tolerated, in steps of 0.5 mg at intervals of at least every 2 weeks, adjusted according to response; maximum 6 mg per day
- Child 7–11 years (body-weight 20–29 kg): Initially 1 mg once daily, dose to be taken before bedtime, then increased in steps of 1 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–6 mg once daily; maximum 8 mg per day
- Child 7–11 years (body-weight 30 kg and above): Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
- Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if

continued →

tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response, maintenance up to 8 mg once daily; maximum 12 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Titrate at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite abnormal · back pain · behaviour abnormal · confusion · dizziness · drowsiness · dysarthria · fatigue · gait abnormal · irritability · movement disorders · nausea · vertigo · vision disorders · weight increased
  - **Uncommon** Suicidal behaviours
  - **Frequency not known** Homicidal ideation · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** EvGr Avoid—embryotoxic in *animal* studies. Ⓜ See also *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** EvGr Caution in mild to moderate impairment; avoid in severe impairment. Ⓜ
  Dose adjustments EvGr Maximum 8 mg per day in mild to moderate impairment. Ⓜ
- **RENAL IMPAIRMENT** EvGr Avoid in moderate or severe impairment. Ⓜ
- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
  Patients may need to be maintained on a specific manufacturer's branded or generic perampanel product.
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Perampanel (*Fycompa*®) for the adjunctive treatment of partial-onset seizures with or without secondary generalised seizures in patients with epilepsy aged 12 years and older (December 2012)** SMC No. 819/12 Recommended with restrictions
- **Perampanel oral suspension (*Fycompa*®) for the adjunctive treatment of partial-onset seizures with or without secondary generalised seizures in patients with epilepsy aged 12 years and older (August 2019)** SMC No. SMC2172 Recommended with restrictions

All Wales Medicines Strategy Group (AWMSG) decisions

- **Perampanel (*Fycompa*®) for the adjunctive treatment of partial-onset seizures with or without secondary generalised seizures in patients from 4 years of age up to 12 years of age (May 2021)** AWMSG No. 4770 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

CAUTIONARY AND ADVISORY LABELS 3, 8
EXCIPIENTS: May contain Sorbitol

- **Fycompa** (Eisai Ltd)
  Perampanel 500 microgram per 1 ml Fycompa 0.5mg/ml oral suspension sugar-free | 340 ml PoM £127.50 DT = £127.50

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8, 25

- **Fycompa** (Eisai Ltd)
  Perampanel 2 mg Fycompa 2mg tablets | 7 tablet PoM £35.00 DT = £35.00 | 28 tablet PoM £140.00 DT = £140.00
  Perampanel 4 mg Fycompa 4mg tablets | 28 tablet PoM £140.00 DT = £140.00
  Perampanel 6 mg Fycompa 6mg tablets | 28 tablet PoM £140.00 DT = £140.00
  Perampanel 8 mg Fycompa 8mg tablets | 28 tablet PoM £140.00 DT = £140.00
  Perampanel 10 mg Fycompa 10mg tablets | 28 tablet PoM £140.00 DT = £140.00
  Perampanel 12 mg Fycompa 12mg tablets | 28 tablet PoM £140.00 DT = £140.00

Phenytoin

11-Nov-2021

- **INDICATIONS AND DOSE**

Tonic-clonic seizures | Focal seizures

- BY MOUTH
- Child 1 month-11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
- Child 12-17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration
- INITIALLY BY SLOW INTRAVENOUS INJECTION
- Neonate: Loading dose 18 mg/kg, dose to be administered over 20–30 minutes, then (by mouth) 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), adjusted according to response, dose also adjusted according to plasma-phenytoin concentration.

Prevention and treatment of seizures during or following neurosurgery or severe head injury

- BY MOUTH
- Child: Initially 2.5 mg/kg twice daily, then adjusted according to response to 4–8 mg/kg daily, dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day

Status epilepticus | Acute symptomatic seizures associated with head trauma or neurosurgery

- INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Neonate: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily.
- Child 1 month-11 years: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily

- Child 12–17 years: Loading dose 20 mg/kg, then (by intravenous infusion or by slow intravenous injection) up to 100 mg 3–4 times a day

DOSE EQUIVALENCE AND CONVERSION

- Preparations containing phenytoin sodium are **not** bioequivalent to those containing phenytoin base (such as *Epanutin Infatabs*® and *Epanutin*® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy. However, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

● **UNLICENSED USE**

- With oral use Licensed for use in children (age range not specified by manufacturer).
- With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH AND SEVERE HARM FROM ERROR WITH INJECTABLE PHENYTOIN (NOVEMBER 2016)

Use of injectable phenytoin is error-prone throughout the prescribing, preparation, administration and monitoring processes; all relevant staff should be made aware of appropriate guidance on the safe use of injectable phenytoin to reduce the risk of error.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

● **CONTRA-INDICATIONS**

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 688

SPECIFIC CONTRA-INDICATIONS

- With intravenous use Second- and third-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome

● **CAUTIONS**

GENERAL CAUTIONS Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary) · may exacerbate absence and myoclonic seizures

SPECIFIC CAUTIONS

- With intravenous use Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available

CAUTIONS, FURTHER INFORMATION MHRA advises consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

EvGr Intramuscular phenytoin should not be used (absorption is slow and erratic). Ⓜ

● **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Agranulocytosis · bone disorders · bone fracture · bone marrow disorders · cerebrovascular insufficiency · coarsening of the facial features · confusion · constipation · dizziness · drowsiness · Dupuytren's contracture · dysarthria · eosinophilia · fever · gingival hyperplasia (maintain good oral hygiene) · granulocytopenia · hair changes · headache · hepatic disorders · hypersensitivity · insomnia · joint disorders · leucopenia · lip swelling · lymphatic abnormalities · macrocytosis · megaloblastic anaemia · movement disorders · muscle twitching · nausea · neoplasms · nephritis tubulointerstitial · nervousness · nystagmus · paraesthesia · Peyronie's disease · polyarteritis nodosa · pseudolymphoma · sensory peripheral polyneuropathy · severe cutaneous adverse reactions (SCARs) · skin reactions · suicidal behaviours · systemic lupus erythematosus (SLE) · taste altered · thrombocytopenia · tremor · vertigo · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Electrolyte imbalance · pneumonitis · vitamin D deficiency
- With parenteral use Arrhythmias · atrial conduction depression (more common if injection too rapid) · cardiac arrest · extravasation necrosis · hypotension · injection site necrosis · purple glove syndrome · respiratory arrest (more common if injection too rapid) · respiratory disorders · tonic seizure (more common if injection too rapid) · ventricular conduction depression (more common if injection too rapid) · ventricular fibrillation (more common if injection too rapid)

SIDE-EFFECTS, FURTHER INFORMATION **Rash** Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.

Bradycardia and hypotension With intravenous use; reduce rate of administration if bradycardia or hypotension occurs.

Overdose Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

● **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 211 for more information.

● **PREGNANCY** An increased risk of major congenital malformations and possibility of adverse effects on neurodevelopment have been seen with phenytoin, see *Pregnancy* in Epilepsy p. 211.

Monitoring Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction.

EvGr Doses should be adjusted on the basis of plasma-drug concentration monitoring—phenytoin pharmacokinetics altered during pregnancy. Ⓜ

● **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of accumulation and toxicity due to decreased protein binding in hepatic impairment, hypoalbuminaemia, or hyperbilirubinaemia).

Dose adjustments

- With oral use Manufacturer advises consider dose reduction.
- With intravenous use Manufacturer advises consider maintenance dose reduction.

● **PRE-TREATMENT SCREENING** HLAB* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens- Johnson syndrome).

● **MONITORING REQUIREMENTS**

- Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding.
- Trough plasma concentration for optimum response: neonate–3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).

- Blood counts Manufacturer recommends blood counts (but evidence of practical value uncertain).
- With intravenous use Monitor ECG and blood pressure.

DIRECTIONS FOR ADMINISTRATION Manufacturer advises each injection or infusion should be preceded and followed by an injection of Sodium Chloride 0.9% through the same needle or catheter to avoid local venous irritation.

- With intravenous use EvGr For *intravenous injection*, give into a large vein at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). D Manufacturer advises for *intravenous infusion*, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron). EvGr Give at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). D Complete administration within 1 hour of preparation.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

PATIENT AND CARER ADVICE

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

Rufinamide

11-Nov-2021

INDICATIONS AND DOSE

Adjunctive treatment of seizures in Lennox-Gastaut syndrome without valproate (initiated by a specialist)

BY MOUTH

- Child 1–3 years: Initially 5 mg/kg twice daily, then increased in steps of up to 5 mg/kg twice daily (max. per dose 22.5 mg/kg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days to the target dose (maximum dose), each dose should be given to the nearest 0.5 mL
- Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days
- Child 4–17 years (body-weight 30–50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4–17 years (body-weight 50.1–70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4–17 years (body-weight 70.1 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate (initiated by a specialist)

BY MOUTH

- Child 1–3 years: Initially 5 mg/kg twice daily, then increased in steps of up to 5 mg/kg twice daily (max. per dose 15 mg/kg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days to the target dose (maximum dose), each dose should be given to the nearest 0.5 mL
- Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4–17 years (body-weight 30–50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 600 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4–17 years (body-weight 50.1–70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 800 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4–17 years (body-weight 70.1 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.1 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

Sodium valproate

22-Apr-2022

(Valproate sodium)

- **INDICATIONS AND DOSE**

All forms of epilepsy

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Neonate: Initially 20 mg/kg once daily; maintenance 10 mg/kg twice daily.
  - Child 1 month-11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
  - Child 12-17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
- BY RECTUM
  - Neonate: Initially 20 mg/kg once daily; maintenance 10 mg/kg twice daily.
  - Child 1 month-11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
  - Child 12-17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day

Initiation of valproate treatment

- INITIALLY BY INTRAVENOUS INJECTION
  - Neonate: 10 mg/kg twice daily.
  - Child 1 month-11 years: Initially 10 mg/kg, then (by intravenous infusion or by intravenous injection) increased to 20–40 mg/kg daily in

continued →

2–4 divided doses, alternatively (by continuous intravenous infusion) increased to 20–40 mg/kg daily, monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily

- Child 12-17 years: Initially 10 mg/kg, followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes

Continuation of valproate treatment

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Child: If switching from oral therapy to intravenous therapy give the same dose as current oral daily dose, give over 3–5 minutes by intravenous injection *or* in 2–4 divided doses by intravenous infusion

EPILIM CHRONOSPHERE ®

All forms of epilepsy

- BY MOUTH
- Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPILIM CHRONO ®

All forms of epilepsy

- BY MOUTH
- Child (body-weight 20 kg and above): Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA ® CAPSULES

All forms of epilepsy

- BY MOUTH
- Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA ® GRANULES

All forms of epilepsy

- BY MOUTH
- Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPIVAL ®

All forms of epilepsy

- BY MOUTH
- Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: VALPROATE MEDICINES: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILDBEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk).

Valproate must not be used in women and girls of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met (see *Conception and contraception*) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see *Pregnancy*).

Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see *Prescribing and dispensing Information*). The MHRA advises that:

- GPs must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;
- Specialists must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as necessary, explain clearly the conditions as outlined in the supporting materials and complete and sign the Risk Acknowledgement Form—copies of the form must be given to the patient or carer and sent to their GP;
- Pharmacists must ensure valproate medicines are dispensed in whole packs whenever possible—all packs dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.

MHRA/CHM ADVICE: VALPROATE MEDICINES: ARE YOU ACTING IN COMPLIANCE WITH THE PREGNANCY PREVENTION MEASURES? (DECEMBER 2018)

The MHRA advises that all healthcare professionals must continue to identify and review all female patients on valproate, including when used outside licensed indications (off-label use) and provide them with the patient information materials every time they attend appointments or receive their medicines.

Guidance for psychiatrists on the withdrawal of, and alternatives to, valproate in women of childbearing potential who have a psychiatric illness is available from the Royal College of Psychiatrists.

MHRA/CHM ADVICE: VALPROATE MEDICINES AND SERIOUS HARMS IN PREGNANCY: NEW ANNUAL RISK ACKNOWLEDGEMENT FORM AND CLINICAL GUIDANCE FROM PROFESSIONAL BODIES TO SUPPORT COMPLIANCE WITH THE PREGNANCY PREVENTION PROGRAMME (APRIL 2019)

The Annual Risk Acknowledgement Form has been updated and should be used for all future reviews of female patients on valproate. Specialists should comply with guidance given on the form if they consider the patient is not at risk of pregnancy, including the need for review in case her risk status changes.

Guidance has been published to support healthcare professionals with the use of valproate. These include a summary by NICE of their guidance and safety advice, pan-college guidance by national healthcare bodies, and paediatric guidance by the British Paediatric Neurology Association and the Royal College of Paediatrics and Child Health.

MHRA/CHM ADVICE (UPDATED JANUARY 2020): VALPROATE PREGNANCY PREVENTION PROGRAMME

The Guide for Healthcare Professionals has been updated and should be used for all future reviews of female patients on valproate medicines, in conjunction with other supporting materials (see *Prescribing and dispensing Information*).

MHRA/CHM ADVICE (UPDATED MAY 2020): VALPROATE PREGNANCY PREVENTION PROGRAMME: TEMPORARY ADVICE FOR MANAGEMENT DURING CORONAVIRUS (COVID-19)
The MHRA has issued temporary guidance for female patients on valproate during the coronavirus (COVID-19) pandemic to support adherence to the Pregnancy Prevention Programme, particularly for those who are shielding due to other health conditions, and should be followed until further notice.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)
See Epilepsy p. 211.

- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction · urea cycle disorders (risk of hyperammonaemia)
- **CAUTIONS** Systemic lupus erythematosus

  CAUTIONS, FURTHER INFORMATION The MHRA advises consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

  ▸ Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. EvGr Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities). M
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**

  GENERAL SIDE-EFFECTS

  ▸ **Common or very common** Abdominal pain · agitation · alopecia (regrowth may be curly) · anaemia · behaviour abnormal · concentration impaired · confusion · deafness · diarrhoea · drowsiness · haemorrhage · hallucination · headache · hepatic disorders · hypersensitivity · hyponatraemia · memory loss · menstrual cycle irregularities · movement disorders · nail disorder · nausea · nystagmus · oral disorders · seizures · stupor · thrombocytopenia · tremor · urinary disorders · vomiting · weight increased

  ▸ **Uncommon** Androgenetic alopecia · angioedema · bone disorders · bone fracture · bone marrow disorders · coma · encephalopathy · hair changes · hypothermia · leucopenia · pancreatitis · paraesthesia · parkinsonism · peripheral oedema · pleural effusion · renal failure · SIADH · skin reactions · vasculitis · virilism

  ▸ **Rare or very rare** Agranulocytosis · cerebral atrophy · cognitive disorder · dementia · diplopia · gynaecomastia · hyperammonaemia · hypothyroidism · infertility male · learning disability · myelodysplastic syndrome · nephritis tubulointerstitial · obesity · polycystic ovaries · red blood cell abnormalities · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · urine abnormalities

  ▸ **Frequency not known** Alertness increased · suicidal behaviours

  SPECIFIC SIDE-EFFECTS

  ▸ **Common or very common**

  ▸ With intravenous use Dizziness

  SIDE-EFFECTS, FURTHER INFORMATION **Hepatic dysfunction** Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

  Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.
- **PREGNANCY** For *migraine prophylaxis*[unlicensed] and *bipolar disorder*, the MHRA advises that valproate must not be used. For *epilepsy*, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinaemia) reported. Neonatal hepatotoxicity also reported. See also *Pregnancy* in Epilepsy p. 211.

  Monitoring Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.
- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**

  Dose adjustments EvGr Consider dose reduction. M
- **MONITORING REQUIREMENTS**

  ▸ Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

  ▸ Monitor liver function before therapy and during first 6 months especially in patients most at risk.

  ▸ Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.
- **TREATMENT CESSATION** EvGr Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks. A
- **DIRECTIONS FOR ADMINISTRATION**

  ▸ With intravenous use Manufacturer advises for *intravenous injection*, give over 3–5 minutes. For *intravenous infusion*, dilute with Glucose 5% *or* Sodium Chloride 0.9%. Reconstitute *Epilim* ® with solvent provided then dilute with infusion fluid if required. Displacement value may be significant, consult local guidelines.

  ▸ With rectal use For *rectal administration*, expert sources advise sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion).

  EPIVAL ® Manufacturer advises tablets may be halved but not crushed or chewed.

  EPISENTA ® CAPSULES Manufacturer advises contents of capsule may be mixed with soft food or drink that is cold or at room temperature and swallowed immediately without chewing.

  EPILIM ® SYRUP Manufacturer advises may be diluted, preferably in Syrup BP; use within 14 days.

  EPISENTA ® GRANULES, EPILIM CHRONOSPHERE ® Manufacturer advises granules may be mixed with soft food or drink that is cold or at room temperature and swallowed immediately without chewing.

● **PRESCRIBING AND DISPENSING INFORMATION** The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: *Patient Guide*, *Guide for Healthcare Professionals*, *Risk Acknowledgement Form*, and for pharmacists, *Patient Cards* and *Stickers with warning symbols*; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.

The Royal Pharmaceutical Society has also produced a safe supply algorithm, available at: www.rpharms.com/safesupplyvalproate

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral sodium valproate product.

EPILIM CHRONOSPHERE ® Prescribe dose to the nearest whole 50-mg sachet.

● **PATIENT AND CARER ADVICE**

Valproate use by women and girls The MHRA advises women and girls should **not** stop taking valproate without first discussing it with their doctor.

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

Medicines for Children leaflet: Sodium valproate for preventing seizures www.medicinesforchildren.org.uk/medicines/sodium-valproate-for-preventing-seizures/

EPISENTA ® CAPSULES Patients and carers should be counselled on the administration of capsules.

EPISENTA ® GRANULES, EPILIM CHRONOSPHERE ® Patients and carers should be counselled on the administration of granules.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 8, 10, 21, 25

Stiripentol

05-May-2021

INDICATIONS AND DOSE

Adjunctive therapy of refractory generalised tonic-clonic seizures in patients with severe myoclonic epilepsy in infancy (Dravet syndrome) in combination with clobazam and valproate (under expert supervision)

- BY MOUTH
- Child 3–5 years: Initially 20 mg/kg daily in 2–3 divided doses for 1 week, then increased to 30 mg/kg daily in 2–3 divided doses for 1 week, then increased to 50 mg/kg daily in 2–3 divided doses
- Child 6–11 years: Initially 20 mg/kg daily in 2–3 divided doses for 1 week, then increased in steps of 10 mg/kg daily in 2–3 divided doses, dose to be increased at intervals of 1 week to 50 mg/kg daily in 2–3 divided doses
- Child 12–17 years: Initially 20 mg/kg daily in 2–3 divided doses for 1 week, then increased to 30 mg/kg daily in 2–3 divided doses for 1 week, then increased in steps of 5 mg/kg daily in 2–3 divided doses, dose to be increased at intervals of 1 week, until the optimum dose is reached based on clinical judgement; maximum 50 mg/kg per day

DOSE EQUIVALENCE AND CONVERSION

- Stiripentol capsules and oral powder sachets are **not** bioequivalent. If a switch of formulation is required, manufacturer advises this is done under clinical supervision in case of intolerance.

Tiagabine

11-Nov-2021

INDICATIONS AND DOSE

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

- BY MOUTH
- Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 30–45 mg daily in 2–3 divided doses

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)

- BY MOUTH
- Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses

IMPORTANT SAFETY INFORMATION

Topiramate

11-Nov-2021

- **INDICATIONS AND DOSE**

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

- BY MOUTH
- Child 6-17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 250–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome

- BY MOUTH
- Child 2-17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day

Migraine prophylaxis

- BY MOUTH
- Child 16-17 years: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses, if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 200 mg per day

- **UNLICENSED USE** Not licensed for use in children for migraine prophylaxis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)
See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)
See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)
See Epilepsy p. 211.

- **CAUTIONS** Avoid in Acute porphyrias p. 688 · risk of metabolic acidosis · risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - **Common or very common** Alopecia · anaemia · anxiety · appetite abnormal · asthenia · behaviour abnormal · cognitive impairment · concentration impaired · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · ear discomfort · eye disorders · feeling abnormal · fever · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hypersensitivity · joint disorders · malaise · memory loss · mood altered · movement disorders · muscle complaints · muscle weakness · nasal complaints · nasopharyngitis · nausea · oral disorders · pain · seizures · sensation abnormal · skin reactions · sleep disorders · speech impairment · taste altered · tinnitus · tremor · urinary disorders · urolithiases · vertigo · vision disorders · vomiting · weight changes
  - **Uncommon** Abnormal sensation in eye · anhidrosis · arrhythmias · aura · cerebellar syndrome · consciousness impaired · crying · drooling · dry eye · dysgraphia · dysphonia · eosinophilia · facial swelling · hallucinations · hearing impairment · hyperthermia · hypokalaemia · hypotension · influenza like illness · learning disability · leucopenia · lymphadenopathy · metabolic acidosis · musculoskeletal stiffness · palpitations · pancreatitis · paranasal sinus hypersecretion · peripheral coldness · peripheral neuropathy · polydipsia · psychotic disorder · renal pain · sexual dysfunction · smell altered · suicidal

behaviours · syncope · thinking abnormal · thirst · thrombocytopenia · vasodilation

- **Rare or very rare** Eye inflammation · face oedema · glaucoma · hepatic disorders · limb discomfort · neutropenia · Raynaud's phenomenon · renal tubular acidosis · severe cutaneous adverse reactions (SCARs) · unresponsive to stimuli

SIDE-EFFECTS, FURTHER INFORMATION Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intra-ocular pressure occurs: seek specialist ophthalmological advice; use appropriate measures to reduce intra-ocular pressure and stop topiramate as rapidly as feasible.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises perform pregnancy test before the initiation of treatment—a highly effective contraceptive method is advised in women of child-bearing potential; patients should be fully informed of the risks related to the use of topiramate during pregnancy.
- **PREGNANCY** An increased risk of major congenital malformations and intra-uterine growth restriction has been seen with topiramate, see *Pregnancy* in Epilepsy p. 211 for further details. *For epilepsy* manufacturer advises consider alternative treatment options. *For migraine prophylaxis* manufacturer advises avoid.
  Monitoring Manufacturer advises in case of administration during first trimester, careful prenatal monitoring should be performed.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of decreased clearance).
- **RENAL IMPAIRMENT** EvGr Use with caution. Ⓜ
  Dose adjustments EvGr Half usual starting and maintenance dose if creatinine clearance 70 mL/minute or less (reduced clearance and longer time to steady-state plasma concentration). Ⓜ See p. 15.
- **DIRECTIONS FOR ADMINISTRATION**
  TOPAMAX® CAPSULES Manufacturer advises swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.
- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
  Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic topiramate product.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Topiramate for preventing seizures www.medicinesforchildren.org.uk/medicines/topiramate-for-preventing-seizures/
  TOPAMAX® CAPSULES Patients or carers should be given advice on how to administer *Topamax® Sprinkle* capsules.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

- Topiramate (Non-proprietary)
  Topiramate 10 mg per 1 ml Topiramate 50mg/5ml oral suspension sugar free sugar-free | 150 ml PoM £186.00–£195.18 DT = £195.18
  Topiramate 20 mg per 1 ml Topiramate 100mg/5ml oral suspension sugar free sugar-free | 280 ml PoM £279.12 DT = £279.12

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

- Topiramate (Non-proprietary)
  Topiramate 25 mg Topiramate 25mg tablets | 60 tablet PoM £19.29 DT = £1.34
  Topiramate 50 mg Topiramate 50mg tablets | 60 tablet PoM £31.69 DT = £1.57
  Topiramate 100 mg Topiramate 100mg tablets | 60 tablet PoM £56.76 DT = £1.90
  Topiramate 200 mg Topiramate 200mg tablets | 60 tablet PoM £110.23 DT = £33.21
- Topamax (Janssen-Cilag Ltd)
  Topiramate 25 mg Topamax 25mg tablets | 60 tablet PoM £19.29 DT = £1.34
  Topiramate 50 mg Topamax 50mg tablets | 60 tablet PoM £31.69 DT = £1.57
  Topiramate 100 mg Topamax 100mg tablets | 60 tablet PoM £56.76 DT = £1.90
  Topiramate 200 mg Topamax 200mg tablets | 60 tablet PoM £110.23 DT = £33.21

Capsule

CAUTIONARY AND ADVISORY LABELS 3, 8

- Topamax (Janssen-Cilag Ltd)
  Topiramate 15 mg Topamax 15mg sprinkle capsules | 60 capsule PoM £14.79 DT = £14.79
  Topiramate 25 mg Topamax 25mg sprinkle capsules | 60 capsule PoM £22.18 DT = £22.18
  Topiramate 50 mg Topamax 50mg sprinkle capsules | 60 capsule PoM £36.45 DT = £36.45

Valproic acid

10-May-2021

- **INDICATIONS AND DOSE**

CONVULEX®

Epilepsy

- BY MOUTH
- Child 1 month–11 years: Initially 10–15 mg/kg daily in 2–4 divided doses, max. 600 mg daily; usual maintenance 25–30 mg/kg daily in 2–4 divided doses, doses up to 60 mg/kg daily in 2–4 divided doses in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- Child 12–17 years: Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days; usual maintenance 1–2 g daily in 2–4 divided doses, max. 2.5 g daily in 2–4 divided doses

DOSE EQUIVALENCE AND CONVERSION

- *Convulex®* has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: VALPROATE MEDICINES: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILDBEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk).

Valproate must not be used in women and girls of childbearing potential unless the conditions of the

Pregnancy Prevention Programme are met (see *Conception and contraception*) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see *Pregnancy*).

Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see *Prescribing and dispensing information*). The MHRA advises that:

- GPs must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;
- Specialists must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as necessary, explain clearly the conditions as outlined in the supporting materials and complete and sign the Risk Acknowledgement Form—copies of the form must be given to the patient or carer and sent to their GP;
- Pharmacists must ensure valproate medicines are dispensed in whole packs whenever possible—all packs dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.

MHRA/CHM ADVICE: VALPROATE MEDICINES: ARE YOU ACTING IN COMPLIANCE WITH THE PREGNANCY PREVENTION MEASURES? (DECEMBER 2018)

The MHRA advises that all healthcare professionals must continue to identify and review all female patients on valproate, including when used outside licensed indications (off-label use) and provide them with the patient information materials every time they attend appointments or receive their medicines.

Guidance for psychiatrists on the withdrawal of, and alternatives to, valproate in women of childbearing potential who have a psychiatric illness is available from the Royal College of Psychiatrists.

MHRA/CHM ADVICE: VALPROATE MEDICINES AND SERIOUS HARMS IN PREGNANCY: NEW ANNUAL RISK ACKNOWLEDGEMENT FORM AND CLINICAL GUIDANCE FROM PROFESSIONAL BODIES TO SUPPORT COMPLIANCE WITH THE PREGNANCY PREVENTION PROGRAMME (APRIL 2019)

The Annual Risk Acknowledgement Form has been updated and should be used for all future reviews of female patients on valproate. Specialists should comply with guidance given on the form if they consider the patient is not at risk of pregnancy, including the need for review in case her risk status changes.

Guidance has been published to support healthcare professionals with the use of valproate. These include a summary by NICE of their guidance and safety advice, pan-college guidance by national healthcare bodies, and paediatric guidance by the British Paediatric Neurology Association and the Royal College of Paediatrics and Child Health.

MHRA/CHM ADVICE (UPDATED JANUARY 2020): VALPROATE PREGNANCY PREVENTION PROGRAMME

The Guide for Healthcare Professionals has been updated and should be used for all future reviews of female patients on valproate medicines, in conjunction with other supporting materials (see *Prescribing and dispensing Information*).

MHRA/CHM ADVICE (UPDATED MAY 2020): VALPROATE PREGNANCY PREVENTION PROGRAMME: TEMPORARY ADVICE FOR MANAGEMENT DURING CORONAVIRUS (COVID-19)

The MHRA has issued temporary guidance for female patients on valproate during the coronavirus (COVID-19) pandemic to support adherence to the Pregnancy Prevention Programme, particularly for those who are shielding due to other health conditions, and should be followed until further notice.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction · urea cycle disorders (risk of hyperammonaemia)
- **CAUTIONS** Systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

- Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. EvGr Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities). M

  The MHRA advises consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS** Abdominal pain · alertness increased · alopecia (regrowth may be curly) · anaemia · behaviour abnormal · bone disorders · bone fracture · cerebral atrophy · coma · confusion · consciousness impaired · dementia · diarrhoea · diplopia · drowsiness · encephalopathy · fine postural tremor · gastrointestinal disorder · gynaecomastia · haemorrhage · hallucination · hearing loss · hepatic disorders · hirsutism · hyperammonaemia · leucopenia · menstrual cycle irregularities · movement disorders · nail disorder · nausea · obesity · pancreatitis · pancytopenia · parkinsonism · peripheral oedema · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · suicidal behaviours · thrombocytopenia · urine abnormalities · vasculitis · vomiting · weight increased

  SIDE-EFFECTS, FURTHER INFORMATION **Hepatic dysfunction** Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

  Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.
- **PREGNANCY** For *migraine prophylaxis*[unlicensed] and *bipolar disorder*, the MHRA advises that valproate must not be used. For *epilepsy*, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional

Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinaemia). Neonatal hepatotoxicity also reported. See also *Pregnancy* in Epilepsy p. 211.

Monitoring Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**
  Dose adjustments EvGr Consider dose reduction. M
- **MONITORING REQUIREMENTS**
  - Monitor closely if dose greater than 45 mg/kg daily.
  - Monitor liver function before therapy and during first 6 months especially in patients most at risk.
  - Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.
- **TREATMENT CESSATION** EvGr In bipolar disorder, avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks. A
- **PRESCRIBING AND DISPENSING INFORMATION** The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: *Patient Guide*, *Guide for Healthcare Professionals*, *Risk Acknowledgement Form*, and for pharmacists, *Patient Cards* and *Stickers with warning symbols*; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.

  The Royal Pharmaceutical Society has also produced a safe supply algorithm, available at: www.rpharms.com/safesupplyvalproate

  CONVULEX® Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral valproic acid product.
- **PATIENT AND CARER ADVICE**
  Valproate use by women and girls The MHRA advises women and girls should **not** stop taking valproate without first discussing it with their doctor.
  Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.
  Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.
  Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 8, 10, 21, 25

- **Convulex** (G.L. Pharma UK Ltd) ▼
  Valproic acid 150 mg Convulex 150mg gastro-resistant capsules | 30 capsule PoM £2.80
  Valproic acid 300 mg Convulex 300mg gastro-resistant capsules | 30 capsule PoM £5.60
  Valproic acid 500 mg Convulex 500mg gastro-resistant capsules | 30 capsule PoM £7.38

Vigabatrin

11-Nov-2021

- **INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

- BY MOUTH
  - Neonate: Initially 15–20 mg/kg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg).
  - Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)
  - Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)
  - Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily
- BY RECTUM
  - Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)
  - Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)
  - Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

Monotherapy in the management of infantile spasms in West's syndrome (under expert supervision)

- BY MOUTH
  - Neonate: Initially 15–25 mg/kg twice daily, to be adjusted according to response over 7 days to usual maintenance dose; usual maintenance 40–50 mg/kg twice daily (max. per dose 75 mg/kg).
  - Child 1 month-1 year: Initially 15–25 mg/kg twice daily, to be adjusted according to response over 7 days to usual maintenance dose; usual maintenance 40–50 mg/kg twice daily (max. per dose 75 mg/kg)

- **UNLICENSED USE** Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF Publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)
See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)
See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)
See Epilepsy p. 211.

- **CONTRA-INDICATIONS** Visual field defects
- **CAUTIONS** History of behavioural problems · history of depression · history of psychosis

  CAUTIONS, FURTHER INFORMATION Vigabatrin may worsen seizures. EvGr It should be avoided in absence, myoclonic, tonic and atonic seizures. A

- Visual field defects Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. EvGr Visual field testing should be carried out before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered. M

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare or very rare** Suicidal behaviours

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With oral use Abdominal pain · alopecia · anaemia · anxiety · arthralgia · behaviour abnormal · concentration impaired · depression · dizziness · drowsiness · eye disorders · fatigue · headache · insomnia · memory loss · mood altered · nausea · oedema · paraesthesia · speech disorder · thinking abnormal · tremor · vision disorders · vomiting · weight increased
- **Uncommon**
- With oral use Movement disorders · psychotic disorder · seizure (patients with myoclonic seizures at greater risk) · skin reactions
- **Rare or very rare**
- With oral use Angioedema · encephalopathy · hallucination · hepatitis · optic neuritis
- **Frequency not known**
- With oral use Intramyelinic oedema (particularly in infants) · movement disorder (in infantile spasms) · muscle tone increased

SIDE-EFFECTS, FURTHER INFORMATION **Encephalopathic symptoms** Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely -reduce dose or withdraw.

Visual field defects About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.

- **PREGNANCY** EvGr Avoid unless essential—toxicity in *animal* studies. M See also *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **RENAL IMPAIRMENT**

Dose adjustments EvGr Consider reduced dose or increased dose interval if creatinine clearance less than 60 mL/minute. M See p. 15.

- **MONITORING REQUIREMENTS** Closely monitor neurological function.
- **DIRECTIONS FOR ADMINISTRATION**
- With oral use EvGr The contents of a sachet of granular powder should be dissolved in at least 100 mL of water, fruit juice or milk immediately before taking. M Expert sources advise film-coated tablets may be crushed and dispersed in liquid.
- With oral use EvGr Soluble tablets should be dissolved in a small volume of water (approximately 5 or 10 mL) before administration. M
- With rectal use Expert sources advise contents of a sachet of granular powder should be dissolved in a small amount of water and administered rectally.
- **PATIENT AND CARER ADVICE** Patients and their carers should be warned to report any new visual symptoms that develop.

Medicines for Children leaflet: Vigabatrin for preventing seizures www.medicinesforchildren.org.uk/medicines/vigabatrin-for-preventing-seizures/

Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled or hazardous tasks—increased risk of visual field defects.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Vigabatrin (*Kigabeq*®) for children from 1 month to less than 7 years of age: as monotherapy for the treatment of infantile spasms (West's syndrome); in combination with other antiepileptic medicinal products for patients with resistant partial epilepsy (focal onset seizures) with or without secondary generalisation, where all other appropriate medicinal product combinations have proved inadequate or have not been tolerated (June 2021)** SMC No. SMC2352 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Soluble tablet

Zonisamide

11-Nov-2021

- **INDICATIONS AND DOSE**

Adjunctive treatment for refractory focal seizures with or without secondary generalisation

- BY MOUTH
- Child 6–17 years (body-weight 20–54 kg): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6–8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
- Child 6–17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)
See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)
See Epilepsy p. 211.

- **CAUTIONS** History of eye disorders · low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children) · metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) · risk factors for renal stone formation (particularly predisposition to nephrolithiasis)

  CAUTIONS, FURTHER INFORMATION EvGr Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in warm environment (fatal cases of heat stroke reported in children). M
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - **Common or very common** Alopecia · anxiety · appetite decreased · ataxia · bradyphrenia · concentration impaired · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · fatigue · fever · gastrointestinal discomfort · hypersensitivity · influenza like illness · insomnia · memory loss · mood altered · nausea · nystagmus · paraesthesia · peripheral oedema · psychosis · rash (consider discontinuation) · skin reactions · speech disorder · tremor · urolithiases · vision disorders · vomiting · weight decreased
  - **Uncommon** Behaviour abnormal · gallbladder disorders · hallucination · hypokalaemia · increased risk of infection · leucopenia · respiratory disorders · seizures · suicidal behaviours · thrombocytopenia
  - **Rare or very rare** Agranulocytosis · angle closure glaucoma · anhidrosis · bone marrow disorders · coma · dyspnoea · eye pain · heat stroke · hepatocellular injury · hydronephrosis · leucocytosis · lymphadenopathy · metabolic acidosis · myasthenic syndrome · neuroleptic malignant syndrome · pancreatitis · renal failure · renal tubular acidosis · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · urine abnormal
  - **Frequency not known** Sudden unexplained death in epilepsy
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in sulfonamide hypersensitivity.

  Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 211 for more information.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during treatment and for one month after last dose—avoid in women of childbearing potential not using effective contraception unless clearly necessary and the potential benefit outweighs risk; patients should be fully informed of the risks related to the use of zonisamide during pregnancy.
- **PREGNANCY** An increased risk of intra-uterine growth restriction has been seen with zonisamide, see *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** Manufacturer advises avoid for 4 weeks after last dose.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
  Dose adjustments Initially increase dose at 2-week intervals if mild or moderate impairment.
- **RENAL IMPAIRMENT**
  Dose adjustments Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).
- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

  Patients may need to be maintained on a specific manufacturer's branded or generic zonisamide product.
- **PATIENT AND CARER ADVICE** Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.
  Medicines for Children leaflet: Zonisamide for preventing seizures

  GENERAL SIDE-EFFECTS Agitation · agranulocytosis · anticonvulsant hypersensitivity syndrome · behaviour abnormal · bone disorders · bone fracture · cognitive impairment · confusion · depression · drowsiness · folate deficiency · hepatic disorders · memory loss · movement disorders · nystagmus · respiratory depression · severe cutaneous adverse reactions (SCARs) · skin reactions · suicidal behaviours

  SPECIFIC SIDE-EFFECTS
  - With oral use Hallucination · hypotension · megaloblastic anaemia · thrombocytopenia
  - With parenteral use Anaemia · aplastic anaemia · Dupuytren's contracture · hypocalcaemia · irritability

  Overdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 944.
- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 211 for more information.
- **PREGNANCY** An increased risk of major congenital malformations and intra-uterine growth restriction, and possibility of adverse effects on neurodevelopment have been seen with phenobarbital, see *Pregnancy* in Epilepsy p. 211 for further details.
- **BREAST FEEDING** Avoid if possible; drowsiness may occur.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** EvGr Use with caution in mild to moderate impairment; avoid in severe impairment. Ⓜ
- **MONITORING REQUIREMENTS**
  - Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use For administration by *mouth*, tablets may be crushed.
  - With intravenous use EvGr For *intravenous injection*, dilute injection solution 1 in 10 with Water for Injections; Ⓜ give at a rate not more than 1 mg/kg/minute.
- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG position statement *Choosing an Oral Liquid Medicine for Children* states that recommended practice in the UK is to use an ethanol-free unlicensed 50 mg/5 mL liquid for the oral administration of phenobarbital to children when an oral liquid is required. Phenobarbital Elixir BP (15 mg/5 mL) contains 38% v/v of ethanol (alcohol), and so there is potential for accumulation when ingested repeatedly, especially in young children with low or immature metabolic capacity.

  Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer's product.
- **PATIENT AND CARER ADVICE**

  Medicines for Children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/medicines/phenobarbital-for-preventing-seizures/
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 8

- **Phenobarbital (Non-proprietary)**

  Phenobarbital 15 mg Phenobarbital 15mg tablets | 28 tablet PoM £24.95 DT = £24.23 CD3

  Phenobarbital 30 mg Phenobarbital 30mg tablets | 28 tablet PoM £5.99 DT = £0.96 CD3

  Phenobarbital 60 mg Phenobarbital 60mg tablets | 28 tablet PoM £8.15 DT = £8.15 CD3

Solution for injection

EXCIPIENTS: May contain Propylene glycol

- **Phenobarbital (Non-proprietary)**

  Phenobarbital sodium 30 mg per 1 ml Phenobarbital 30mg/1ml solution for injection ampoules | 10 ampoule PoM £131.20–£131.29 DT = £131.25 CD3

  Phenobarbital sodium 60 mg per 1 ml Phenobarbital 60mg/1ml solution for injection ampoules | 10 ampoule PoM £138.52 DT = £138.52 CD3

  Phenobarbital sodium 200 mg per 1 ml Phenobarbital 200mg/1ml solution for injection ampoules | 10 ampoule PoM £112.86–£112.94 DT = £112.90 CD3

Primidone

10-May-2021

- **INDICATIONS AND DOSE**

All forms of epilepsy except typical absence seizures

▸ BY MOUTH

- Child 1 month-1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily
- Child 2–4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily
- Child 5–8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg

every 3 days, adjusted according to response; maintenance 375–500 mg twice daily

- Child 9–17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response

  Primidone 50 mg Primidone 50mg tablets | 100 tablet PoM £127.96 DT = £118.17
  Primidone 250 mg Primidone 250mg tablets | 100 tablet PoM £139.90 DT = £93.25

HYPNOTICS, SEDATIVES AND ANXIOLYTICS › BENZODIAZEPINES

Benzodiazepines

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BENZODIAZEPINES AND OPIOIDS: REMINDER OF RISK OF POTENTIALLY FATAL RESPIRATORY DEPRESSION (MARCH 2020)

The MHRA reminds healthcare professionals that benzodiazepines and benzodiazepine-like drugs co-prescribed with opioids can produce additive CNS depressant effects, thereby increasing the risk of sedation, respiratory depression, coma, and death. Healthcare professionals are advised to only co-prescribe if there is no alternative and, if necessary, the lowest possible doses should be given for the shortest duration. Patients should be closely monitored for signs of respiratory depression at initiation of treatment and when there is any change in prescribing, such as dose adjustments or new interactions. If methadone is co-prescribed with a benzodiazepine or benzodiazepine-like drug, the respiratory depressant effect of methadone may be delayed; patients should be monitored for at least 2 weeks after initiation or changes in prescribing. Patients should be informed of the signs and symptoms of respiratory depression and sedation, and advised to seek urgent medical attention should these occur.

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency · marked neuromuscular respiratory weakness · obsessional states · phobic states · sleep apnoea syndrome · unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · history of alcohol dependence or abuse · history of drug dependence or abuse · myasthenia gravis · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence · respiratory disease

  CAUTIONS, FURTHER INFORMATION
  - Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
- **SIDE-EFFECTS**
  - **Common or very common** Alertness decreased · anxiety · ataxia · confusion · depression · dizziness · drowsiness · dysarthria · fatigue · headache · hypotension · mood altered · muscle weakness · nausea · respiratory depression (particularly with high dose and intravenous use—facilities for its treatment are essential) · sleep disorders · tremor · vision disorders · withdrawal syndrome

- **Uncommon** Agitation (more common in children and elderly) · anterograde amnesia · behaviour abnormal · hallucination · libido disorder · rash
- **Rare or very rare** Aggression (more common in children and elderly) · blood disorder · delusions · jaundice · paradoxical drug reaction · restlessness (with sedative and peri-operative use) · urinary retention
- **Frequency not known** Drug dependence

Overdose Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 944.

- **PREGNANCY** Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment; avoid in severe impairment. Benzodiazepines with a shorter half-life are considered safer.
  Dose adjustments In general, manufacturers advise dose reduction in mild to moderate impairment, adjust dose according to response.
- **RENAL IMPAIRMENT** In general, manufacturers advise caution (risk of increased cerebral sensitivity to benzodiazepines).
  Dose adjustments In general, manufacturers advise to consider dose reduction.
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks May cause drowsiness, impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; effects of alcohol increased. Moreover the hangover effects of a night dose may impair performance on the following day.

  For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see *Drugs and driving* under Guidance on prescribing p. 1.

245

Clobazam

26-Oct-2021

- **INDICATIONS AND DOSE**

Adjunct in epilepsy

- BY MOUTH
  - Child 1 month–5 years: Initially 125 micrograms/kg twice daily, dose to be increased if necessary every 5 days, maintenance 250 micrograms/kg twice daily (max. per dose 500 micrograms/kg twice daily); maximum 30 mg per day
  - Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day

Monotherapy for catamenial (menstruation) seizures (usually for 7–10 days each month, just before and during menstruation) (under expert supervision) | Cluster seizures

- BY MOUTH
  - Child 1 month–5 years: Initially 125 micrograms/kg twice daily, dose to be increased if necessary every 5 days, maintenance 250 micrograms/kg twice daily (max. per dose 500 micrograms/kg twice daily); maximum 30 mg per day
  - Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day

- **UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed as monotherapy.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Clobazam has been confused with clonazepam; care must be taken to ensure the correct drug is prescribed and dispensed.

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 211.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 211 and see also *Prescribing and dispensing information*.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 211.

- **CONTRA-INDICATIONS** Respiratory depression
- **CAUTIONS** Muscle weakness · organic brain changes

  CAUTIONS, FURTHER INFORMATION The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.
- **INTERACTIONS** → Appendix 1: benzodiazepines
- **SIDE-EFFECTS** Appetite decreased · consciousness impaired · constipation · drug abuse · dry mouth · fall · gait unsteady · libido loss · movement disorders · muscle spasms · nystagmus · psychotic disorder · respiratory disorder · severe cutaneous adverse reactions (SCARs) · skin reactions · speech impairment · suicidal behaviours · weight increased
- **PREGNANCY** See *Pregnancy* in Epilepsy p. 211.
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
  Monitoring All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.
- **MONITORING REQUIREMENTS** Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.
- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

  Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic clobazam product.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Clobazam for preventing seizures

ANTIEPILEPTICS › BARBITURATES

Thiopental sodium

(Thiopentone sodium)

10-May-2021

- **INDICATIONS AND DOSE**

Prolonged status epilepticus

- INITIALLY BY SLOW INTRAVENOUS INJECTION

- Neonate: Initially up to 2 mg/kg, then (by continuous intravenous infusion) up to 8 mg/kg/hour, adjusted according to response.

- Child: Initially up to 4 mg/kg, then (by continuous intravenous infusion) up to 8 mg/kg/hour, adjusted according to response

Induction of anaesthesia

- BY SLOW INTRAVENOUS INJECTION

- Neonate: Initially up to 2 mg/kg, then 1 mg/kg, repeated if necessary; maximum 4 mg/kg per course.

- Child: Initially up to 4 mg/kg, then 1 mg/kg, repeated if necessary; maximum 7 mg/kg per course

- **UNLICENSED USE** Not licensed for use in status epilepticus. Not licensed for use by intravenous infusion.

IMPORTANT SAFETY INFORMATION

Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · myotonic dystrophy
- **CAUTIONS** Acute circulatory failure (shock) · avoid intra-arterial injection · cardiovascular disease · hypovolaemia · reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain) · respiratory diseases (avoid in acute asthma)
- **INTERACTIONS** → Appendix 1: thiopental
- **SIDE-EFFECTS**
- **Common or very common** Arrhythmia · myocardial contractility decreased
- **Frequency not known** Appetite decreased · circulatory collapse · cough · electrolyte imbalance · extravasation necrosis · hypotension · respiratory disorders · skin eruption · sneezing
- **PREGNANCY** May depress neonatal respiration when used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments Manufacturer advises dose reduction.

- **RENAL IMPAIRMENT** EvGr Caution in severe impairment. M
- **DIRECTIONS FOR ADMINISTRATION** EvGr For *intravenous injection*, reconstitute 500-mg vial with 20 mL Water for Injections to give 25 mg/mL solution; give over at least 10–15 seconds; for *intravenous infusion* reconstituted solution may be further diluted with Sodium Chloride 0.9%. M
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to

take patients home. The dangers of taking **alcohol** should also be emphasised.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder for solution for injection

- **Thiopental sodium (Non-proprietary)**
  Thiopental sodium 500 mg Thiopental 500mg powder for solution for injection vials | 10 vial PoM £57.60-£69.00

HYPNOTICS, SEDATIVES AND ANXIOLYTICS › BENZODIAZEPINES

245

Diazepam

11-Nov-2021

- **INDICATIONS AND DOSE**

Tetanus

- BY INTRAVENOUS INJECTION
- Child: 100–300 micrograms/kg every 1–4 hours
- BY INTRAVENOUS INFUSION, OR BY NASODUODENAL TUBE
- Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm

- BY MOUTH
- Child 1-11 months: Initially 250 micrograms/kg twice daily
- Child 1-4 years: Initially 2.5 mg twice daily
- Child 5-11 years: Initially 5 mg twice daily
- Child 12-17 years: Initially 10 mg twice daily; maximum 40 mg per day

Status epilepticus | Febrile convulsions | Convulsions due to poisoning

- BY INTRAVENOUS INJECTION
- Neonate: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes.
- Child 1 month-11 years: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes
- Child 12-17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3–5 minutes
- BY RECTUM
- Neonate: 1.25–2.5 mg, then 1.25–2.5 mg after 10 minutes if required.
- Child 1 month-1 year: 5 mg, then 5 mg after 10 minutes if required
- Child 2-11 years: 5–10 mg, then 5–10 mg after 10 minutes if required
- Child 12-17 years: 10–20 mg, then 10–20 mg after 10 minutes if required

Life-threatening acute drug-induced dystonic reactions

- BY INTRAVENOUS INJECTION
- Child 1 month-11 years: 100 micrograms/kg, repeated if necessary, to be given over 3–5 minutes
- Child 12-17 years: 5–10 mg, repeated if necessary, to be given over 3–5 minutes

- **UNLICENSED USE**
- With rectal use *Diazepam Desitin*®, *Diazepam Rectubes*®, and *Stesolid Rectal Tubes*® not licensed for use in children under 1 year.

IMPORTANT SAFETY INFORMATION

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · CNS depression · compromised airway · hyperkinesis · respiratory depression
- **CAUTIONS**

GENERAL CAUTIONS Muscle weakness · organic brain changes · parenteral administration (close observation required until full recovery from sedation)

SPECIFIC CAUTIONS

- With intravenous use High risk of venous thrombophlebitis with intravenous use (reduced by using an emulsion formulation)

CAUTIONS, FURTHER INFORMATION

- Special precautions for intravenous injection When given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available.

- **INTERACTIONS** → Appendix 1: benzodiazepines
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Appetite abnormal · gastrointestinal disorder · movement disorders · muscle spasms · palpitations · sensory disorder
- **Uncommon** Concentration impaired · constipation · diarrhoea · hypersalivation · skin reactions · speech slurred · vomiting
- **Rare or very rare** Bradycardia · bronchial secretion increased · cardiac arrest · dry mouth · gynaecomastia · heart failure · leucopenia · loss of consciousness · memory loss · psychosis · respiratory arrest · sexual dysfunction · syncope · urinary incontinence · vertigo
- **Frequency not known** Apnoea · nystagmus

SPECIFIC SIDE-EFFECTS

- **Rare or very rare**
- With intravenous or oral use Psychiatric disorder

- **PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.
  Epilepsy and Pregnancy Register All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).
- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use Diazepam is adsorbed by plastics of infusion bags and giving sets. Expert sources advise emulsion formulation preferred for intravenous use.
- With intravenous use EvGr For *continuous intravenous infusion* (emulsion) (*Diazemuls*®), dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For *continuous intravenous infusion* (solution) (*Diazepam*, Hameln), dilute to a concentration of max. 80 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%. M

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how and when to administer rectal diazepam. Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

F 245

Lorazepam

14-Oct-2021

● **INDICATIONS AND DOSE**

Premedication

- BY MOUTH
- Child 1 month–11 years: 50–100 micrograms/kg (max. per dose 4 mg), to be given at least 1 hour before procedure, same dose may be given the night before procedure in addition to, or to replace, dose before procedure
- Child 12–17 years: 1–4 mg, to be given at least 1 hour before procedure, same dose may be given the night before procedure in addition to, or to replace, dose before procedure
- BY INTRAVENOUS INJECTION
- Child: 50–100 micrograms/kg (max. per dose 4 mg), to be administered 30–45 minutes before procedure

Status epilepticus | Febrile convulsions | Convulsions caused by poisoning

- BY SLOW INTRAVENOUS INJECTION
- Neonate: 100 micrograms/kg for 1 dose, then 100 micrograms/kg after 10 minutes if required for 1 dose, to be administered into a large vein.
- Child 1 month–11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose, to be administered into a large vein
- Child 12–17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein

● **UNLICENSED USE** Not licensed for use in febrile convulsions. Not licensed for use in convulsions caused by poisoning. Not licensed for use as intravenous premedication in children under 12 years. Not licensed for use as oral premedication in children under 5 years.

IMPORTANT SAFETY INFORMATION

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

● **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · CNS depression · compromised airway · respiratory depression

● **CAUTIONS** Muscle weakness · organic brain changes · parenteral administration

CAUTIONS, FURTHER INFORMATION

- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
- Special precautions for parenteral administration When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

● **INTERACTIONS** → Appendix 1: benzodiazepines

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Apnoea · asthenia · coma · disinhibition · extrapyramidal symptoms · hypothermia · memory loss · speech slurred · suicidal behaviours
- **Uncommon** Allergic dermatitis · constipation · sexual dysfunction
- **Rare or very rare** Agranulocytosis · hyponatraemia · pancytopenia · SIADH · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With parenteral use Vertigo
- **Rare or very rare**
- With oral use Saliva altered
- **Frequency not known**
- With oral use Psychosis

- With parenteral use Leucopenia

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For *intravenous injection*, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.

- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

Midazolam

10-Nov-2021

- **INDICATIONS AND DOSE**

Status epilepticus | Febrile convulsions

- BY BUCCAL ADMINISTRATION

- Neonate: 300 micrograms/kg, then 300 micrograms/kg after 10 minutes if required.
- Child 1–2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
- Child 3–11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
- Child 1–4 years: 5 mg, then 5 mg after 10 minutes if required
- Child 5–9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
- Child 10–17 years: 10 mg, then 10 mg after 10 minutes if required

- INITIALLY BY INTRAVENOUS INJECTION

- Neonate: Initially 150–200 micrograms/kg, followed by (by continuous intravenous infusion) 60 micrograms/kg/hour, (by continuous intravenous infusion) increased in steps of 60 micrograms/kg/hour every 15 minutes (max. per dose 300 micrograms/kg/hour) until seizure controlled.
- Child: Initially 150–200 micrograms/kg, followed by (by continuous intravenous infusion) 60 micrograms/kg/hour, (by continuous intravenous infusion) increased in steps of 60 micrograms/kg/hour every 15 minutes (max. per dose 300 micrograms/kg/hour) until seizure controlled

Conscious sedation for procedures

- BY MOUTH
- Child: 500 micrograms/kg (max. per dose 20 mg), to be administered 30–60 minutes before procedure using a liquid special or injection solution given by mouth

- BY BUCCAL ADMINISTRATION
- Child 6 months-9 years: 200–300 micrograms/kg (max. per dose 5 mg)
- Child 10–17 years (body-weight up to 70 kg): 6–7 mg
- Child 10–17 years (body-weight 70 kg and above): 6–7 mg (max. per dose 8 mg)

- BY RECTUM
- Child 6 months-11 years: 300–500 micrograms/kg, to be administered 15–30 minutes before procedure

- BY INTRAVENOUS INJECTION
- Child 1 month-5 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 6 mg per course
- Child 6-11 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 10 mg per course
- Child 12-17 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 7.5 mg per course

Premedication

- BY MOUTH
- Child: 500 micrograms/kg (max. per dose 20 mg), to be administered 15–30 minutes before the procedure using a liquid special or injection solution given by mouth

- BY RECTUM
- Child 6 months-11 years: 300–500 micrograms/kg, to be administered 15–30 minutes before induction

Induction of anaesthesia (but rarely used)

- BY SLOW INTRAVENOUS INJECTION
- Child 7-17 years: Initially 150 micrograms/kg (max. per dose 7.5 mg), dose to be given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes before subsequent dosing, then 50 micrograms/kg every 2 minutes (max. per dose 2.5 mg) if required; maximum 500 micrograms/kg per course; maximum 25 mg per course

Sedation of patient receiving intensive care

- INITIALLY BY SLOW INTRAVENOUS INJECTION
- Child 6 months-11 years: Initially 50–200 micrograms/kg, to be administered over at least 3 minutes, followed by (by continuous intravenous infusion) 30–120 micrograms/kg/hour, adjusted according to response, initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia
- Child 12-17 years: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, followed by (by continuous intravenous infusion) 30–200 micrograms/kg/hour, adjusted according to response, initial dose may not be required and lower maintenance doses needed if opioid

continued →

analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia

▸ BY CONTINUOUS INTRAVENOUS INFUSION

- Neonate up to 32 weeks corrected gestational age: 60 micrograms/kg/hour for 24 hours, then reduced to 30 micrograms/kg/hour, adjusted according to response for maximum treatment duration of 4 days.
- Neonate 32 weeks corrected gestational age and above: 60 micrograms/kg/hour, adjusted according to response for maximum treatment duration of 4 days.
- Child 1–5 months: 60 micrograms/kg/hour, adjusted according to response

MIPROSED ®

Conscious sedation for procedures | Premedication

▸ BY MOUTH

- Child 6 months-14 years: 250–500 micrograms/kg (max. per dose 20 mg), to be administered 15 to 30 minutes before procedure or anaesthesia

OZALIN ®

Conscious sedation for procedures | Premedication

▸ BY MOUTH

- Child 6 months-17 years: 250 micrograms/kg (max. per dose 20 mg), to be administered 30 minutes before procedure or anaesthesia

● **UNLICENSED USE** Oromucosal solution not licensed for use in children under 3 months. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature.

Injection not licensed for use in status epilepticus or febrile convulsions.

Injection not licensed for use by mouth for conscious sedation or premedication.

Not licensed for use by buccal administration for conscious sedation.

IMPORTANT SAFETY INFORMATION

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

NHS NEVER EVENT: MIS-SELECTION OF HIGH-STRENGTH MIDAZOLAM DURING CONSCIOUS SEDATION (JANUARY 2018).

In clinical areas performing conscious sedation, high-strength preparations (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should **not** be selected in place of the 1 mg/mL preparation.

The areas where high-strength midazolam is used should be restricted to those performing general anaesthesia, intensive care, palliative care, or areas where its use has been formally risk-assessed in the organisation. In these situations the higher strength may be more appropriate to administer the prescribed dose.

It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

● **CONTRA-INDICATIONS** CNS depression · compromised airway · severe respiratory depression

● **CAUTIONS**

GENERAL CAUTIONS Cardiac disease · children (particularly if cardiovascular impairment) · debilitated patients (reduce dose) · hypothermia · hypovolaemia (risk of severe hypotension) · neonates · risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) · vasoconstriction

SPECIFIC CAUTIONS

- With intravenous use Concentration of midazolam in children under 15 kg not to exceed 1 mg/mL

CAUTIONS, FURTHER INFORMATION

- Recovery when used for sedation Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

● **INTERACTIONS** → Appendix 1: benzodiazepines

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Vomiting
- **Uncommon** Skin reactions
- **Rare or very rare** Dry mouth · dyspnoea · hiccups · movement disorders · respiratory disorders
- **Frequency not known** Disinhibition (severe; with sedative and peri-operative use) · vertigo

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With buccal use Level of consciousness decreased
- **Rare or very rare**
- With buccal use Apnoea · bradycardia · cardiac arrest · constipation · physical assault · vasodilation
- **Frequency not known**
- With buccal use Appetite increased · fall · gastrointestinal disorder · saliva altered · thrombosis · urinary incontinence
- With oral use Angioedema · arrhythmias · asthenia · enuresis · gait instability · hypersalivation · hypoxia · myopathy
- With parenteral use Angioedema · apnoea · appetite increased · bradycardia · cardiac arrest · constipation · drug abuse · drug withdrawal seizure · embolism and thrombosis · fall · gastrointestinal disorder · level of consciousness decreased · physical assault · saliva altered · urinary incontinence · vasodilation
- With rectal use Angioedema · apnoea · appetite increased · bradycardia · cardiac arrest · constipation · drug abuse · drug withdrawal seizure · embolism and thrombosis · fall · gastrointestinal disorder · level of consciousness decreased · physical assault · respiratory arrest (more common with high doses) · saliva altered · urinary incontinence · vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Higher doses are associated with prolonged sedation and risk of hypoventilation. The co-administration of midazolam with other sedative, hypnotic, or CNS-depressant drugs results in increased sedation. Midazolam accumulates in adipose tissue, which can significantly prolong sedation, especially in patients with obesity, hepatic impairment or renal impairment.

Overdose There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5mg/mL in 2mL and 10mL ampoules, or 2mg/mL in 5mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

● **BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

● **HEPATIC IMPAIRMENT** For *parenteral preparations* manufacturer advises caution in all degrees of impairment. **Dose adjustments** For *parenteral preparations* manufacturer advises consider dose reduction in all degrees of impairment.

● **RENAL IMPAIRMENT** Manufacturer advises use with caution in chronic renal failure.

● **DIRECTIONS FOR ADMINISTRATION**

▸ With intravenous use For *intravenous infusion* (*Hypnovel*®), give continuously *in* Glucose 5% *or* Sodium chloride 0.9%. For *intravenous injection* in status epilepticus and febrile convulsions, dilute with Glucose 5% or Sodium Chloride 0.9%; rapid intravenous injection (less than 2 minutes) may cause seizure-like myoclonus in preterm neonate. For neonate and children under 15 kg dilute to a max. concentration of 1 mg/mL. *Neonatal intensive care*, dilute 15 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour.

▸ With oral use For administration *by mouth* for sedation and premedication, licensed oral solutions are available. Alternatively, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola.

MIPROSED® EvGr Miprosed 5 mg/mL oral solution may be diluted with apple juice or blackcurrant cordial. Ⓜ

OZALIN® Ozalin® 2 mg/mL oral solution is supplied in single-use glass ampoules and the dose must be measured using the graduated oral applicator and filter straw provided.

● **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of midazolam is required, the following strength is used: 10 mg/5 mL.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how and when to administer midazolam oromucosal solution.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

2 Mental health disorders

2.1 Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder

04-Aug-2018

Description of condition

Attention deficit hyperactivity disorder (ADHD) is a behavioural disorder characterised by hyperactivity,

impulsivity and inattention, which can lead to functional impairment such as psychological, social, educational or occupational difficulties. While these symptoms tend to co-exist, some patients are predominantly hyperactive and impulsive, while others are principally inattentive. Symptoms typically appear in children aged 3–7 years, but may not be recognised until after 7 years of age, especially if hyperactivity is not present. ADHD is more commonly diagnosed in males than in females.

ADHD is usually a persisting disorder and some children continue to have symptoms throughout adolescence and into adulthood, where inattentive symptoms tend to persist, and hyperactive-impulsive symptoms tend to recede over time. ADHD is also associated with an increased risk of disorders such as oppositional defiant disorder (ODD), conduct disorder, and possibly mood disorders such as depression, mania, and anxiety, as well as substance misuse.

Aims of treatment

The aims of treatment are to reduce functional impairment, severity of symptoms, and to improve quality of life.

Non-drug treatment

EvGr Children and their parents, or carers should be advised about the importance of a balanced diet, good nutrition and regular exercise. If hyperactivity appears to be influenced by certain foods or drinks, parents or carers should be advised to keep a diary of food or drinks consumed and the associated behaviour. A referral to a dietician should be made where appropriate. A

Environmental modifications are changes made to the physical environment that can help reduce the impact of ADHD symptoms on a child's day-to-day life. EvGr The modifications should be specific to the child's circumstances, and may involve changes to seating arrangements, lighting and noise, reducing distractions, optimising education by having shorter periods of focus with movement breaks, and the appropriate use of teaching assistants at school. These changes should form part of the discussion at the time of diagnosis of ADHD and be trialled and reviewed for effectiveness before drug treatment is started.

In children aged under 5 years, an ADHD-focused parent-training programme that teaches parents or carers behaviour therapy techniques is recommended as first-line treatment. Specialist advice should be sought if symptoms are still causing significant impairment after completion of the programme and implementation of environmental modifications.

In children aged 5 years and over, advice about ADHD and ADHD-focused support should be given to all parents or carers. In children with ADHD and symptoms of oppositional defiant disorder or conduct disorder, a training programme specific for the coexisting condition, involving either the parent or carer with or without the child is also recommended. Drug treatment should be reserved for children whose symptoms are causing persistent and significant impairment of at least one area of function (such as interpersonal relationships, education attainment, and risk awareness) despite environmental modifications.

In adolescents, a course of cognitive behavioural therapy (CBT) in combination with drug treatment should be considered for those who have had some benefit from drug treatment, but still have symptoms causing significant impairment in at least one area of function (such as social skills with peers, problem-solving, self-control, active listening skills, or dealing with and expressing feelings). A

Drug treatment

Child aged under 5 years

EvGr Drug treatment should only be considered in children under 5 years of age on advice from a specialist ADHD service. A

Child aged 5 years and over

EvGr Drug treatment should be initiated by a specialist trained in the diagnosis and management of ADHD. Following dose stabilisation, continuation and monitoring of drug treatment can be undertaken by the child's general practitioner under a shared care arrangement. Children with ADHD and anxiety disorder, tic disorder, or autism spectrum disorder should be offered the same treatment options as other children with ADHD. A Treatment options for ADHD are not licensed for use in children under 6 years of age.

EvGr Methylphenidate hydrochloride p. 256 is recommended as first-line treatment. If a 6-week trial of methylphenidate hydrochloride p. 256 at the maximum tolerated dose does not reduce symptoms and associated impairment, consider switching to lisdexamfetamine mesilate p. 259. Dexamfetamine sulfate p. 258 can be given to children who are having a beneficial response to lisdexamfetamine mesilate but cannot tolerate its longer duration of effect.

Modified-release preparations of stimulants are preferred because of their pharmacokinetic profile, convenience, improved adherence, reduced risk of drug diversion (drugs being forwarded to others for non-prescription use or misuse), and the lack of need to be taken to school. Immediate-release preparations can be given when more flexible dosing regimens are required, or during initial dose titration. A combination of a modified-release and immediate-release preparation taken at different times of the day can be used to extend the duration of effect. The magnitude, duration of effect, and side-effects of stimulants vary between patients.

Atomoxetine p. 255 or guanfacine p. 260 can be given to children who are intolerant of both methylphenidate hydrochloride p. 256 and lisdexamfetamine mesilate, or if symptoms have not responded to separate 6-week trials of both drugs following adequate dose titration and consideration of alternative preparations. If sustained orthostatic hypotension or fainting episodes occur with guanfacine p. 260 treatment, the dose should be reduced or an alternative treatment offered.

Advice from, or referral to a tertiary specialist ADHD service should be considered if the child is unresponsive to one or more stimulant drugs (e.g. methylphenidate hydrochloride p. 256 and lisdexamfetamine mesilate) and one non-stimulant drug (e.g. atomoxetine p. 255 and guanfacine p. 260). A specialist service should also be consulted for advice before starting clonidine hydrochloride p. 113 [unlicensed] in children with ADHD and sleep disturbances, rages or tics, and before starting atypical antipsychotics in addition to stimulants in children with ADHD and co-existing pervasive aggression, rages or irritability. A

Other treatment options such as bupropion hydrochloride, modafinil, and tricyclic antidepressants [all unlicensed] have been used in the management of ADHD, but due to limited evidence their use is not recommended without specialist advice.

EvGr Children should be monitored for effectiveness of treatment and side-effects, in addition to changes in sleep pattern, and the potential for stimulant diversion or misuse. If the child develops new, or has worsening of existing seizures, review drug treatment and stop any drug that might be contributing to the seizures; treatment can be cautiously reintroduced if it is unlikely to be the cause. Monitor children for the development of tics associated with stimulant use. If tics are stimulant related, consider a dose reduction, stopping treatment, or changing to a non-stimulant drug. If there is worsening of behaviour, consider adjusting drug treatment and reviewing the diagnosis.

Treatment should be reviewed by a specialist at least once a year and trials of treatment-free periods, or dose reductions considered where appropriate. A

CNS STIMULANTS › CENTRALLY ACTING SYMPATHOMIMETICS

Atomoxetine

26-Oct-2021

● **INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder (initiated by a specialist)

► BY MOUTH

► Child 6–17 years (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day

► Child 6–17 years (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day

● **UNLICENSED USE** Atomoxetine doses in BNF may differ from those in product literature.

Doses above 100 mg daily not licensed.

● **CONTRA-INDICATIONS** Phaeochromocytoma · severe cardiovascular disease · severe cerebrovascular disease

● **CAUTIONS** Aggressive behaviour · cardiovascular disease · cerebrovascular disease · emotional lability · history of seizures · hostility · hypertension · mania · psychosis · QT-interval prolongation · structural cardiac abnormalities · susceptibility to angle-closure glaucoma · tachycardia

● **INTERACTIONS** → Appendix 1: atomoxetine

● **SIDE-EFFECTS**

► **Common or very common** Anxiety · appetite decreased · asthenia · chest pain · constipation · depression · dizziness · drowsiness · gastrointestinal discomfort · headaches · insomnia · mood altered · mydriasis · nausea · skin reactions · tic · vomiting · weight decreased

► **Uncommon** Behaviour abnormal · dyspnoea · hallucination · hyperhidrosis · hypersensitivity · palpitations · psychosis · QT interval prolongation · seizure · sensation abnormal · sinus tachycardia · suicidal behaviour · syncope · tremor · vision blurred

► **Rare or very rare** Genital pain · hepatic disorders · priapism · Raynaud's phenomenon · urinary disorders

► **Frequency not known** Sudden cardiac death

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Avoid-present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises halve dose in moderate impairment and quarter dose in severe impairment.

● **MONITORING REQUIREMENTS**

► Monitor for appearance or worsening of anxiety, depression or tics.

► Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

● **PATIENT AND CARER ADVICE**

Suicidal ideation Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression.

Hepatic impairment Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

Methylphenidate hydrochloride

10-Nov-2021

INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated under specialist supervision)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 4–5 years: Initially 2.5 mg twice daily, increased in steps of 2.5 mg daily if required, at weekly intervals, increased if necessary up to 1.4 mg/kg daily in 2–3 divided doses, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation
- Child 6–17 years: Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

DOSE EQUIVALENCE AND CONVERSION

- When switching from *immediate-release* preparations to *modified-release* preparations—consult product literature.

CONCERTA® XL

Attention deficit hyperactivity disorder

- BY MOUTH
- Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 54 mg once daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 108 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Concerta*® XL 18 mg once daily.

DELMOSART® PROLONGED-RELEASE TABLET

Attention deficit hyperactivity disorder (under expert supervision)

- BY MOUTH
- Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Delmosart*® 18 mg once daily.

EQUASYM® XL

Attention deficit hyperactivity disorder

- BY MOUTH
- Child 6–17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day

MEDIKINET® XL

Attention deficit hyperactivity disorder

- BY MOUTH
- Child 6–17 years: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day

XAGGITIN® XL

Attention deficit hyperactivity disorder (under expert supervision)

- BY MOUTH
- Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Xaggitin*® XL 18 mg once daily.

- **UNLICENSED USE** Doses over 60 mg daily not licensed; doses of *Concerta*® *XL* over 54 mg daily not licensed. Not licensed for use in children under 6 years.
- **CONTRA-INDICATIONS** Anorexia nervosa · arrhythmias · cardiomyopathy · cardiovascular disease · cerebrovascular disorders · heart failure · hyperthyroidism · mania · phaeochromocytoma · psychosis · severe depression · severe hypertension · structural cardiac abnormalities · suicidal tendencies · uncontrolled bipolar disorder · vasculitis
- **CAUTIONS** Agitation · alcohol dependence · anxiety · drug dependence · epilepsy (discontinue if increased seizure frequency) · family history of Tourette syndrome · susceptibility to angle-closure glaucoma · tics
  CONCERTA® XL, DELMOSART® PROLONGED-RELEASE TABLET Dysphagia (dose form not appropriate) · restricted gastro-intestinal lumen (dose form not appropriate)
  XAGGITIN® XL Dysphagia (dose form not appropriate)
- **INTERACTIONS** → Appendix 1: methylphenidate
- **SIDE-EFFECTS**
- **Common or very common** Aggression (or hostility) · alopecia · anxiety · appetite decreased · arrhythmias · arthralgia · behaviour abnormal · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · fever · gastrointestinal discomfort · growth retardation · headaches · hypertension · laryngeal pain · mood altered · movement disorders · nasopharyngitis · nausea · palpitations · sleep disorders · vomiting · weight decreased
- **Uncommon** Chest discomfort · constipation · dyspnoea · fatigue · haematuria · hallucinations · muscle complaints · psychotic disorder · suicidal behaviours · tic · tremor · vision disorders

- **Rare or very rare** Anaemia · angina pectoris · cardiac arrest · cerebrovascular insufficiency · confusion · gynaecomastia · hepatic coma · hyperfocus · hyperhidrosis · leucopenia · mydriasis · myocardial infarction · neuroleptic malignant syndrome · peripheral coldness · Raynaud's phenomenon · seizures · sexual dysfunction · skin reactions · sudden cardiac death · thinking abnormal · thrombocytopenia
- **Frequency not known** Delusions · drug dependence · hyperpyrexia · intracranial haemorrhage · logorrhea · pancytopenia · vasculitis

- **PREGNANCY** Limited experience—avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Limited information available—avoid.
- **MONITORING REQUIREMENTS**
  - Monitor for psychiatric disorders.
  - Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION**

  MEDIKINET® XL Manufacturer advises contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

  EQUASYM® XL Manufacturer advises contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).
- **PRESCRIBING AND DISPENSING INFORMATION** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

  CONCERTA® XL Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

  MEDIKINET® XL Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

  EQUASYM® XL Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).
- **PATIENT AND CARER ADVICE**

  Medicines for Children leaflet: Methylphenidate for ADHD www.medicinesforchildren.org.uk/medicines/methylphenidate-for-adhd/

  Driving and skilled tasks Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.gov.uk/government/organisations/driver-and-vehicle-licensing-agency.

  2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see *Drugs and driving* under Guidance on prescribing p. 1.

  CONCERTA® XL Tablet membrane may pass through gastro-intestinal tract unchanged.

  DELMOSART® PROLONGED-RELEASE TABLET Manufacturer advises tablet membrane may pass through gastro-intestinal tract unchanged.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral suspension, oral solution

CNS STIMULANTS › CENTRALLY ACTING SYMPATHOMIMETICS › AMFETAMINES

Dexamfetamine sulfate

11-May-2021

(Dexamphetamine sulfate)

- **INDICATIONS AND DOSE**

Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

- BY MOUTH
- Child 6–17 years: Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required, usual maximum 1 mg/kg daily, up to 20 mg daily (40 mg daily has been required in some children); maintenance dose to be given in 2–4 divided doses

- **CONTRA-INDICATIONS** Advanced arteriosclerosis · anorexia · arrhythmias (life-threatening) · cardiomyopathies · cardiovascular disease · cerebrovascular disorders · heart failure · history of alcohol abuse · history of drug abuse · hyperexcitability · hyperthyroidism · moderate hypertension · psychiatric disorders · psychosis · severe hypertension · structural cardiac abnormalities · suicidal tendencies

CONTRA-INDICATIONS, FURTHER INFORMATION

- Psychiatric disorders Psychiatric disorders include severe depression, schizophrenia, borderline personality disorder and uncontrolled bipolar disorder. Co-morbidity with psychiatric disorders is common in attention deficit hyperactivity disorder. Manufacturer advises if new psychiatric symptoms develop or exacerbation of psychiatric disorders occurs, continue use only if benefits outweigh risks.

- **CAUTIONS** History of epilepsy (discontinue if seizures occur) · mild hypertension · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

CAUTIONS, FURTHER INFORMATION

- Tics and Tourette syndrome Discontinue use if tics occur.
- Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

- **INTERACTIONS** → Appendix 1: amfetamines

- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain · anxiety · appetite decreased · arrhythmias · arthralgia · behaviour abnormal · depression · dry mouth · headache · mood altered · movement disorders · muscle cramps · nausea · palpitations · poor weight gain · sleep disorders · vertigo · vomiting · weight decreased
- **Rare or very rare** Anaemia · angina pectoris · cardiac arrest · cerebrovascular insufficiency · fatigue · growth retardation · hallucination · hepatic coma · hepatic function abnormal · intracranial haemorrhage · leucopenia · mydriasis · psychosis · seizure · skin reactions · suicidal behaviours · thrombocytopenia · tic (in those at risk) · vasculitis cerebral · vision disorders
- **Frequency not known** Acidosis · alopecia · cardiomyopathy · chest pain · circulatory collapse · colitis ischaemic · concentration impaired · confusion · diarrhoea · dizziness · drug dependence · hyperhidrosis · hypermetabolism · hyperpyrexia · kidney injury · myocardial infarction · neuroleptic malignant syndrome · obsessive-compulsive disorder · reflexes increased · rhabdomyolysis · sexual dysfunction · sudden death · taste altered · tremor

Overdose Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 944.

- **PREGNANCY** Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).
- **BREAST FEEDING** Significant amount in milk—avoid.
- **RENAL IMPAIRMENT** EvGr Use with caution (no information available). M
- **MONITORING REQUIREMENTS**
- Monitor growth in children.
- Monitor for aggressive behaviour or hostility during initial treatment.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets can be halved.
- **PRESCRIBING AND DISPENSING INFORMATION** Data on safety and efficacy of long-term use not complete.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release capsule, oral suspension, oral solution

Oral solution

- **Dexamfetamine sulfate (Non-proprietary)**
  Dexamfetamine sulfate 1 mg per 1 ml Dexamfetamine 5mg/5ml oral solution sugar free sugar-free | 150 ml PoM £114.49 DT = £114.49 CD2

Modified-release capsule

- **Dexamfetamine sulfate (Non-proprietary)**
  Dexamfetamine sulfate 5 mg Dexedrine 5mg Spansules | 100 capsule PoM CD2
  Dexamfetamine sulfate 10 mg Dexedrine 10mg Spansules | 100 capsule PoM CD2
- **Dexedrine Spansules** (Imported (United States))
  Dexamfetamine sulfate 15 mg Dexedrine 15mg Spansules | 100 capsule PoM CD2

Tablet

- **Dexamfetamine sulfate (Non-proprietary)**
  Dexamfetamine sulfate 5 mg Dexamfetamine 5mg tablets | 28 tablet PoM £24.75 DT = £24.73 CD2
- **Amfexa** (Flynn Pharma Ltd)
  Dexamfetamine sulfate 5 mg Amfexa 5mg tablets | 30 tablet PoM £19.89 CD2
  Dexamfetamine sulfate 10 mg Amfexa 10mg tablets | 30 tablet PoM £39.78 DT = £39.78 CD2

Dexamfetamine sulfate 20 mg Amfexa 20mg tablets | 30 tablet PoM £79.56 DT = £79.56 CD2

Lisdexamfetamine mesilate

29-Oct-2020

- **DRUG ACTION** Lisdexamfetamine is a prodrug of dexamfetamine.

- **INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder (initiated by a specialist)

- BY MOUTH
- Child 6-17 years: Initially 30 mg once daily, alternatively initially 20 mg once daily, increased in steps of 10–20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

- **CONTRA-INDICATIONS** Advanced arteriosclerosis · agitated states · hyperthyroidism · moderate hypertension · severe hypertension · symptomatic cardiovascular disease
- **CAUTIONS** Bipolar disorder · history of cardiovascular disease · history of substance abuse · may lower seizure threshold (discontinue if seizures occur) · psychotic disorders · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

CAUTIONS, FURTHER INFORMATION

- Cardiovascular disease Manufacturer advises caution in patients with underlying conditions that might be compromised by increases in blood pressure or heart rate; see also *Contra-indications*.

- **INTERACTIONS** → Appendix 1: amfetamines
- **SIDE-EFFECTS**

- **Common or very common** Abdominal pain upper · anxiety · appetite decreased · behaviour abnormal · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · fatigue · feeling jittery · fever · headache · insomnia · mood altered · nausea · palpitations · psychiatric disorders · skin reactions · tachycardia · tremor · vomiting · weight decreased
- **Uncommon** Cardiomyopathy · erectile dysfunction · hallucination · hyperhidrosis · logorrhea · movement disorders · mydriasis · Raynaud's phenomenon · taste altered · vision blurred
- **Frequency not known** Angioedema · drug dependence · hepatitis allergic · psychotic disorder · seizure · Stevens-Johnson syndrome

Overdose Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 944.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in human milk.
- **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises max. dose 50 mg daily in severe impairment.

- **MONITORING REQUIREMENTS**

- Manufacturer advises monitor for aggressive behaviour or hostility during initial treatment.
- Manufacturer advises monitor pulse, blood pressure, and for psychiatric symptoms before treatment initiation, following each dose adjustment, and at least every 6 months thereafter. Monitor weight in adults before treatment initiation and during treatment; in children, height and weight should be recorded before treatment initiation, and height, weight and appetite monitored at least every 6 months during treatment.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises swallow whole or mix contents of capsule with soft food such as yoghurt or in a glass of water or orange juice; contents should be dispersed completely and consumed immediately.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of capsules.

Driving and skilled tasks Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.gov.uk/government/organisations/driver-and-vehicle-licensing-agency.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Lisdexamfetamine dimesylate (*Elvanse*®) for use as part of a comprehensive treatment programme for attention deficit/hyperactivity disorder (ADHD) in children aged 6 years of age and over when response to previous methylphenidate treatment is considered clinically inadequate (May 2013)** SMC No. 863/13 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions

- **Lisdexamfetamine dimesylate (*Elvanse*®) for use as part of a treatment programme for attention deficit/hyperactivity disorder (ADHD) in children aged 6 years and over when response to previous methylphenidate treatment is considered clinically inadequate. Treatment must be under the supervision of a specialist in childhood and/or adolescent behavioural disorders (December 2013)** AWMSG No. 188 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

SYMPATHOMIMETICS › ALPHA$_2$-ADRENOCEPTOR AGONISTS

Guanfacine

11-May-2021

- **INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)

- BY MOUTH
- Child 6–12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
- Child 13–17 years (body-weight 34–41.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
- Child 13–17 years (body-weight 41.5–49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 5 mg), for optimal weight-adjusted dose titrations, consult product literature
- Child 13–17 years (body-weight 49.5–58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for optimal weight-adjusted dose titrations, consult product literature
- Child 13–17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by half with concurrent use of moderate and potent inhibitors of CYP3A4.
- Manufacturer advises increase dose up to max. 7 mg daily with concurrent use of potent inducers of CYP3A4—no specific recommendation made for children.

- **CAUTIONS** Bradycardia (risk of torsade de pointes) · heart block (risk of torsade de pointes) · history of cardiovascular disease · history of QT-interval prolongation · hypokalaemia (risk of torsade de pointes)
- **INTERACTIONS** → Appendix 1: guanfacine
- **SIDE-EFFECTS**
- **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · headache · hypotension · mood altered · nausea · skin reactions · sleep disorders · urinary disorders · vomiting · weight increased
- **Uncommon** Asthma · atrioventricular block · chest pain · hallucination · loss of consciousness · pallor · seizure · syncope
- **Rare or very rare** Hypertension · hypertensive encephalopathy · malaise
- **Frequency not known** Erectile dysfunction

SIDE-EFFECTS, FURTHER INFORMATION Somnolence and sedation may occur, predominantly during the first 2-3 weeks of treatment and with dose increases; manufacturer advises to consider dose reduction or discontinuation of treatment if symptoms are clinically significant or persistent.

Overdose Features may include hypotension, initial hypertension, bradycardia, lethargy, and respiratory depression. Manufacturer advises that patients who develop lethargy should be observed for development of more serious toxicity for up to 24 hours.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in females of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (pharmacokinetics have not been assessed in paediatric patients with hepatic impairment).
Dose adjustments Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT**
Dose adjustments EvGr Dose reduction may be required in severe impairment and end-stage renal disease (no information available in children with renal impairment). Ⓜ
- **MONITORING REQUIREMENTS**
- Manufacturer advises to conduct a baseline evaluation to identify patients at risk of somnolence, sedation, hypotension, bradycardia, QT-prolongation, and arrhythmia; this should include assessment of cardiovascular status. Monitor for signs of these adverse effects weekly during dose titration and then every 3 months during the first year of treatment, and every 6 months thereafter. Monitor BMI prior to treatment and then every 3 months for the first year of treatment, and every 6 months thereafter. More frequent monitoring is advised following dose adjustments.
- Monitor blood pressure and pulse during dose downward titration and following discontinuation of treatment.
- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal; consider dose tapering to minimise potential withdrawal effects.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid administration with high fat meals (may increase absorption).
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on administration of guanfacine modified-release tablets.
Missed doses Manufacturer advises that patients and carers should inform their prescriber if more than one dose is missed; consider dose re-titration.
Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness and syncope.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

- **Intuniv** (Takeda UK Ltd) ▼

Guanfacine (as Guanfacine hydrochloride) 3 mg Intuniv 3mg modified-release tablets | 28 tablet PoM £65.52 DT = £65.52
Guanfacine (as Guanfacine hydrochloride) 4 mg Intuniv 4mg modified-release tablets | 28 tablet PoM £76.16 DT = £76.16

2.2 Bipolar disorder and mania

Mania and hypomania

14-Oct-2021

Overview

Antimanic drugs are used in bipolar disorder to manage acute episodes of mania or hypomania, and to prevent recurrence. Children with bipolar disorder should be under the care of specialist mental health services.

EvGr An antidepressant drug may also be required for the treatment of co-existing bipolar depression, but should be avoided in children with rapid-cycling bipolar disorder, a recent history of mania or hypomania, or with rapid mood fluctuations. Consider stopping the antidepressant drug if the child develops mania or hypomania. A

Antipsychotic drugs

Aripiprazole p. 277 is licensed for the treatment of moderate to severe manic episodes in adolescents with bipolar disorder.

EvGr Other antipsychotic drugs (such as olanzapine p. 281 [unlicensed use], quetiapine p. 282 [unlicensed use], and risperidone p. 283 [unlicensed use]) are used in the treatment of acute episodes of mania or hypomania in children; if the response to antipsychotic drugs is inadequate, lithium or valproate [unlicensed use] may be added. In children already taking prophylactic treatment with lithium or valproate, if there is no improvement despite optimising the dose of lithium or valproate, an antipsychotic drug may be added to treat an acute episode of mania or hypomania. An antipsychotic drug may also be used concomitantly with lithium or valproate in the initial treatment of severe acute episodes of mania. A See *Important safety information*, *Conception and contraception*, and *Pregnancy* in the valproic acid p. 239 and sodium valproate p. 233 drug monographs.

EvGr Atypical antipsychotics may be used for the long-term management of bipolar disorder in children to prevent recurrence of acute episodes.

When discontinuing antipsychotic drugs, the dose should be reduced gradually over at least 4 weeks to minimise the risk of recurrence. A

Benzodiazepines

EvGr Use of benzodiazepines may be helpful in the initial stages of treatment for behavioural disturbance or agitation in children. A Benzodiazepines should not be used for long periods because of the risk of dependence.

Lithium

EvGr Lithium salts (lithium carbonate p. 262 and lithium citrate p. 263 [unlicensed use]) are used in children for the treatment of acute episodes of mania, and for the long-term management of bipolar disorder to prevent recurrence of acute episodes. A

The decision to give prophylactic lithium must be based on careful consideration of the likelihood of recurrence in the individual child, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy.

Valproate

EvGr Valproate (valproic acid (as the semisodium salt) and sodium valproate) [unlicensed use] is used in children for the treatment of acute episodes of mania, and for the long-term management of bipolar disorder to prevent recurrence of acute episodes. A

MHRA advises due to the high teratogenic risk associated with valproate, it must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. The benefit and risk of valproate therapy should be carefully reconsidered at regular treatment reviews. Valproic acid and sodium valproate must not be used during pregnancy in patients with bipolar disorder. For further information, see *Important safety information*, *Conception and contraception*, and *Pregnancy* in the valproic acid and sodium valproate drug monographs.

Carbamazepine

Expert sources advise carbamazepine p. 218 [unlicensed use] is used in children for the long-term management of bipolar disorder to prevent recurrence of acute episodes.

ANTIPSYCHOTICS › LITHIUM SALTS

Lithium salts

- **CONTRA-INDICATIONS** Addison's disease · cardiac disease associated with rhythm disorder · cardiac insufficiency · dehydration · family history of Brugada syndrome · low sodium diets · personal history of Brugada syndrome · untreated hypothyroidism
- **CAUTIONS** Avoid abrupt withdrawal · cardiac disease · concurrent ECT (may lower seizure threshold) · diuretic treatment (risk of toxicity) · epilepsy (may lower seizure threshold) · myasthenia gravis · psoriasis (risk of exacerbation) · QT interval prolongation · review dose as necessary in diarrhoea · review dose as necessary in intercurrent infection (especially if sweating profusely) · review dose as necessary in vomiting · surgery

CAUTIONS, FURTHER INFORMATION

- Long-term use Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months (more often if there is evidence of deterioration).

  The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

- **SIDE-EFFECTS**
- **Rare or very rare** Nephropathy
- **Frequency not known** Abdominal discomfort · alopecia · angioedema · appetite decreased · arrhythmias · atrioventricular block · cardiomyopathy · cerebellar syndrome · circulatory collapse · coma · delirium · diarrhoea · dizziness · dry mouth · electrolyte imbalance · encephalopathy · folliculitis · gastritis · goitre · hyperglycaemia · hyperparathyroidism · hypersalivation · hypotension · hypothyroidism · idiopathic intracranial hypertension · leucocytosis · memory loss · movement disorders · muscle weakness · myasthenia gravis · nausea · neoplasms · nystagmus · peripheral neuropathy · peripheral oedema · polyuria · QT interval prolongation · reflexes abnormal · renal disorders · renal impairment · rhabdomyolysis · seizure · sexual dysfunction · skin reactions · skin ulcer · speech impairment · taste altered · thyrotoxicosis · tremor · vertigo · vision disorders · vomiting · weight increased

SIDE-EFFECTS, FURTHER INFORMATION **Overdose** Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypernatraemia. With severe overdosage seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 944.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment for women of child bearing potential.
- **PREGNANCY** Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).
  Dose adjustments Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal).
  Monitoring Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).
- **BREAST FEEDING** Present in milk and risk of toxicity in infant—avoid.
- **RENAL IMPAIRMENT** EvGr Caution in mild to moderate impairment; avoid in severe impairment. M
- **MONITORING REQUIREMENTS**
  - Serum concentrations Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.
    Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy).
    A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.
    EvGr Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months for the first year, and every 6 months thereafter. Patients who are taking drugs that interact with lithium, at risk of impaired renal or thyroid function, raised calcium levels or other complications, have poor symptom control or poor adherence, or whose last serum-lithium concentration was 0.8 mmol/litre or higher, should be monitored every 3 months. A Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient's sodium or fluid intake.
  - Manufacturer advises to assess renal, cardiac, and thyroid function before treatment initiation. EvGr An ECG is recommended in patients with cardiovascular disease or risk factors for it. Body-weight or BMI, serum electrolytes, and a full blood count should also be measured before treatment initiation.
  - Monitor body-weight or BMI, serum electrolytes, eGFR, and thyroid function every 6 months during treatment, and more often if there is evidence of impaired renal or thyroid function, or raised calcium levels. A Manufacturer also advises to monitor cardiac function regularly.
- **TREATMENT CESSATION** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.
- **PATIENT AND CARER ADVICE** Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance). Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.
  Lithium treatment packs A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from
  3M
  0845 610 1112
  nhsforms@mmm.uk.com
- **Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving, operating machinery).

261

Lithium carbonate

- **INDICATIONS AND DOSE**

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

- BY MOUTH
- Child 12–17 years: Dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION

- **Preparations vary widely in bioavailability**; changing the preparation requires the same precautions as initiation of treatment.

CAMCOLIT® IMMEDIATE-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

- BY MOUTH
- Child 12–17 years: Initially 1–1.5 g daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

- BY MOUTH
- Child 12–17 years: Initially 300–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

CAMCOLIT® MODIFIED-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

- BY MOUTH
- Child 12–17 years: Initially 1–1.5 g daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

- BY MOUTH
- Child 12–17 years: Initially 300–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

LISKONUM ®

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

- BY MOUTH
- Child 12–17 years: Initially 225–675 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

- BY MOUTH
- Child 12–17 years: Initially 225–450 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- **UNLICENSED USE** Not licensed for aggressive or self-harming behaviour. Not licensed for concomitant therapy with antidepressant medication in children who have had an incomplete response to treatment for acute depression in bipolar disorder. *Camcolit* ® brand not licensed for use in children.
- **INTERACTIONS** → Appendix 1: lithium

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

2.3 Depression

Depression

10-Jul-2019

Description of condition

Depression is characterised by persistent low mood which can present as irritability, fatigue, and/or a loss of interest or pleasure in most activities and may be accompanied by symptoms of anxiety.

Associated symptoms, which determine disease severity, are sleep and appetite disturbance, lack of concentration, low self-confidence, agitation, guilt or self-blame and suicidal thoughts or acts.

Based on the International Statistical Classification of Diseases (ICD-10), depression can be classified as mild (four symptoms), moderate (five to six symptoms) or severe (seven or more symptoms, with or without psychotic symptoms).

Depression in childhood is not common and can have a more gradual onset than in adults. Affecting twice as many adolescent females than males, depression often occurs with other behavioural disorders. In almost half of the cases it resolves spontaneously within the first year.

Non-drug treatment

EvGr When assessing a child or young person with depression, take into account family history of mood disorders, experience of bullying or abuse, any alcohol and

drug misuse and the possibility of parental substance misuse as this may impact on disease severity or affect treatment efficacy.

Any co-morbid diagnoses and developmental, social and educational problems should be assessed and managed, either in sequence or in parallel with the treatment for depression.

St John's wort is a herbal remedy available without prescription for treating mild depression in adults. It should not be used for the treatment of depression in children. Ⓐ

Lifestyle changes

EvGr Regular exercise (45 minutes to 1 hour per session, up to three times a week) following a structured programme for 10 to 12 weeks, should be encouraged. Give children, and their parents or carers, advice about good sleep hygiene, anxiety management, nutrition and the benefits of a balanced diet. Ⓐ

Psychological therapy

EvGr Offer three months of psychological therapy as first-line treatment from a therapist trained in child and adolescent mental health, or a healthcare practitioner specifically trained in the psychological therapy. Therapy options include cognitive behavioural therapy (CBT), interpersonal psychotherapy (IPT), IPT for adolescents (IPT-A), non-directive supportive therapy (NDST), psychodynamic psychotherapy, family therapy, brief psychosocial interventions, and intensive psychological therapy.

In mild depression, for those who do not meet referral criteria or who do not want an intervention, a period of watchful waiting and re-assessment of symptoms within two weeks should be arranged. Ⓐ For further information on criteria for referral to Child and Adolescent Mental Health Services (CAMHS) see NICE clinical guideline **Depression in children and young people** (see *Useful resources*).

Drug treatment

Child aged 5 years and over

EvGr Antidepressants should not be used for the initial treatment of children with mild depression. For cases refractory to psychological treatment, antidepressant therapy may be considered under specialist advice.

Drug treatment should only be prescribed following assessment and diagnosis by a child and adolescent psychiatrist.

When an antidepressant is prescribed, the selective serotonin re-uptake inhibitor (SSRI) fluoxetine p. 266 is the first-line treatment in children.

The use of fluoxetine in children aged 5 to 11 years should be cautiously considered as effectiveness in this age group is not established.

For moderate to severe depression, antidepressants should only be offered to children in combination with concurrent psychological therapy.

In children aged 12 years and over, following multidisciplinary review, combination therapy can be considered as an alternative to psychological monotherapy, or in cases refractory to psychological therapy.

Children should be carefully monitored at the start of treatment (for example weekly contact for the first four weeks or according to individual needs). Following remission (no symptoms and full functioning for at least eight weeks), antidepressant treatment should be continued at the same dose for at least six months.

For children unresponsive to treatment with fluoxetine in combination with a psychological therapy, it is recommended to consider an alternative psychological therapy.

In children who present with severe depression and recurrent depressive episodes who do not respond to or cannot tolerate fluoxetine, citalopram p. 265 [unlicensed indication] or sertraline p. 267 [unlicensed indication] can be used as an alternative under specialist supervision.

Paroxetine, venlafaxine and tricyclic antidepressants should not be used for the treatment of depression in children and young people.

In children aged 12 years and over with very severe depression and life-threatening symptoms (such as suicidal behaviour), or who have not responded to other treatments, electroconvulsive therapy can be considered under specialist care. Ⓐ

Psychotic depression

EvGr Augmenting existing antidepressant treatment with second generation antipsychotics (under specialist supervision) should be considered for children with psychotic depression, although the optimum dose and duration of treatment are unknown. Ⓐ

Suicidal behaviour and antidepressant therapy

EvGr The use of antidepressant drugs has been linked with suicidal thoughts and behaviour, mainly in the early stages of treatment. Children should be monitored for suicidal behaviour, self-harm or hostility, particularly at the beginning of treatment, with medication changes and at times of increased personal stress. Ⓐ For further information on SSRI use and safety, see MHRA/CHM guidance **Selective serotonin reuptake inhibitors (SSRIs) and serotonin and noradrenaline reuptake inhibitors (SNRIs)** (see *Useful resources*).

Other drugs used for Depression Lithium carbonate, p. 262
- Lithium citrate, p. 263

Selective serotonin re-uptake inhibitors

- **DRUG ACTION** Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SSRI/SNRI ANTIDEPRESSANT MEDICINES: SMALL INCREASED RISK OF POSTPARTUM HAEMORRHAGE WHEN USED IN THE MONTH BEFORE DELIVERY (JANUARY 2021)

SSRIs are known to increase the risk of bleeding due to their effect on platelet function. An EU review of observational data found a slightly increased risk of postpartum haemorrhage associated with the use of SSRIs during the month before delivery. This risk may be significant in patients with other risk factors for bleeding disorders.

Healthcare professionals should continue to consider the benefits and risks of antidepressant therapy (particularly in the later stages of pregnancy), and the risks of untreated depression, during pregnancy. Anticoagulant medication in women at high risk of thrombotic events should not be stopped, however, prescribers should be aware of the risk identified.

- **CONTRA-INDICATIONS** Poorly controlled epilepsy · SSRIs should not be used if the patient enters a manic phase
- **CAUTIONS** Cardiac disease · concurrent electroconvulsive therapy · diabetes mellitus · epilepsy (discontinue if convulsions develop) · history of bleeding disorders (especially gastro-intestinal bleeding) · history of mania · susceptibility to angle-closure glaucoma
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite abnormal · arrhythmias · arthralgia · asthenia · concentration impaired · confusion · constipation · depersonalisation · diarrhoea · dizziness · drowsiness · dry mouth · fever · gastrointestinal discomfort · haemorrhage · headache · hyperhidrosis · malaise · mania · memory loss · menstrual cycle irregularities · myalgia · mydriasis · nausea (dose-related) · palpitations · paraesthesia · QT interval prolongation · sexual dysfunction · skin reactions · sleep disorders · taste altered · tinnitus · tremor · urinary disorders · visual impairment · vomiting · weight changes · yawning
  - **Uncommon** Alopecia · angioedema · behaviour abnormal · hallucination · movement disorders · photosensitivity reaction · postural hypotension · seizure · suicidal behaviours · syncope
  - **Rare or very rare** Galactorrhoea · hepatitis · hyperprolactinaemia · hyponatraemia · serotonin syndrome · severe cutaneous adverse reactions (SCARs) · SIADH · thrombocytopenia
  - **Frequency not known** Withdrawal syndrome

  SIDE-EFFECTS, FURTHER INFORMATION Symptoms of sexual dysfunction may persist after treatment has stopped.

  Overdose Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

  For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 944.
- **PREGNANCY** Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (prolonged half-life).
- **TREATMENT CESSATION** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.

  Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more.
- **PATIENT AND CARER ADVICE**

  Driving and skilled tasks May also impair performance of skilled tasks (e.g. driving, operating machinery).

F 264

Citalopram

26-Jul-2021

- **INDICATIONS AND DOSE**

  Major depression

  - BY MOUTH USING TABLETS
  - Child 12-17 years: Initially 10 mg once daily, increased if necessary to 20 mg once daily, dose to be increased over 2–4 weeks; maximum 40 mg per day
  - BY MOUTH USING ORAL DROPS
  - Child 12-17 years: Initially 8 mg once daily, increased if necessary to 16 mg once daily, dose to be increased over 2–4 weeks; maximum 32 mg per day

  DOSE EQUIVALENCE AND CONVERSION

  - 4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.
- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** QT-interval prolongation
- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: SSRIs
- **SIDE-EFFECTS**
  - **Common or very common** Acute angle closure glaucoma · apathy · flatulence · hypersalivation · migraine · rhinitis
  - **Uncommon** Oedema
  - **Rare or very rare** Cough · generalised tonic-clonic seizure
  - **Frequency not known** Hypokalaemia
- **BREAST FEEDING** Present in milk—use with caution.
- **HEPATIC IMPAIRMENT**

  Dose adjustments For *tablets* manufacturer advises lower initial doses, may be increased to max. 20 mg daily; use with extra caution and careful dose titration in severe impairment.

  For *oral drops* manufacturer advises lower initial dose, may be increased to max. 16 mg daily; use with extra caution and careful dose titration in severe impairment.
- **RENAL IMPAIRMENT** EvGr Use with caution; no information available for creatinine clearance less than 20 mL/minute. M See p. 15.
- **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises *Cipramil*® oral drops should be mixed with water, orange juice, or apple juice before taking.
- **PATIENT AND CARER ADVICE** Counselling on administration of oral drops is advised.

  Driving and skilled tasks Patients should be advised of the effects of citalopram on driving and skilled tasks.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  Oral drops

  EXCIPIENTS: May contain Alcohol

  - **Citalopram (Non-proprietary)**

    Citalopram (as Citalopram hydrochloride) 40 mg per 1 ml Citalopram 40mg/ml oral drops sugar free sugar-free | 15 ml PoM £14.09 DT = £7.86
  - **Cipramil** (Lundbeck Ltd)

    Citalopram (as Citalopram hydrochloride) 40 mg per 1 ml Cipramil 40mg/ml drops sugar-free | 15 ml PoM £10.08 DT = £7.86

Tablet

- **Citalopram (Non-proprietary)**
  Citalopram (as Citalopram hydrobromide) 10 mg Citalopram 10mg tablets | 28 tablet PoM £12.36 DT = £0.74 | 250 tablet PoM £13.25

  Citalopram (as Citalopram hydrobromide) 40 mg Citalopram 40mg tablets | 28 tablet PoM £16.47 DT = £0.97
- **Cipramil** (Lundbeck Ltd)
  Citalopram (as Citalopram hydrobromide) 20 mg Cipramil 20mg tablets | 28 tablet PoM £8.95 DT = £0.83

264

Fluoxetine

10-Sep-2020

INDICATIONS AND DOSE

Major depression

- BY MOUTH
- Child 5–17 years: Initially 10 mg daily, increased if necessary up to 20 mg daily, dose to be increased after 1–2 weeks of initial dose, daily dose may be administered as a single or divided dose

PHARMACOKINETICS

- Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).

UNLICENSED USE EvGr Fluoxetine may be used in children from the age of 5 to 7 years for the treatment of major depression A, but it is not licensed for this age group

INTERACTIONS → Appendix 1: SSRIs

SIDE-EFFECTS

- **Common or very common** Chills · feeling abnormal · postmenopausal haemorrhage · uterine disorder · vasodilation · vision blurred
- **Uncommon** Cold sweat · dysphagia · dyspnoea · hypotension · mood altered · muscle twitching · self-injurious behaviour · temperature sensation altered · thinking abnormal
- **Rare or very rare** Buccoglossal syndrome · leucopenia · neutropenia · oesophageal pain · pharyngitis · respiratory disorders · serum sickness · speech disorder · vasculitis
- **Frequency not known** Growth retardation

BREAST FEEDING Present in milk—avoid.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises dose reduction or increasing dose interval.

DIRECTIONS FOR ADMINISTRATION Manufacturer advises dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.

PATIENT AND CARER ADVICE Patients and carers should be counselled on the administration of dispersible tablets.
Medicines for Children leaflet: Fluoxetine for depression, obsessive compulsive disorder and bulimia nervosa
www.medicinesforchildren.org.uk/medicines/fluoxetine-for-obsessive-compulsive-disorder-ocd-depression-and-bulimia-nervosa/
Driving and skilled tasks Patients should be counselled about the effects on driving and skilled tasks.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Fluoxetine (Non-proprietary)**
  Fluoxetine (as Fluoxetine hydrochloride) 10 mg Fluoxetine 10mg tablets | 30 tablet PoM £61.73 DT = £61.73

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 10

- **Olena** (Advanz Pharma)
  Fluoxetine (as Fluoxetine hydrochloride) 20 mg Olena 20mg dispersible tablets sugar-free | 28 tablet PoM £3.44 DT = £3.44

Oral solution

- **Fluoxetine (Non-proprietary)**
  Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Fluoxetine 20mg/5ml oral solution | 70 ml PoM £12.75 DT = £3.62
  Fluoxetine 20mg/5ml oral solution sugar free sugar-free | 70 ml PoM £12.95 DT = £12.95
- **Prozep** (Rosemont Pharmaceuticals Ltd)
  Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Prozep 20mg/5ml oral solution sugar-free | 70 ml PoM £12.95 DT = £12.95

Capsule

- **Fluoxetine (Non-proprietary)**
  Fluoxetine (as Fluoxetine hydrochloride) 10 mg Fluoxetine 10mg capsules | 30 capsule PoM £58.95 DT = £37.50

  Fluoxetine (as Fluoxetine hydrochloride) 60 mg Fluoxetine 60mg capsules | 30 capsule PoM £54.36 DT = £2.40

264

Fluvoxamine maleate

20-Apr-2021

INDICATIONS AND DOSE

Obsessive-compulsive disorder

- BY MOUTH
- Child 8–17 years: Initially 25 mg daily, then increased in steps of 25 mg every 4–7 days (max. per dose 100 mg twice daily) if required, dose to be increased according to response, doses above 50 mg should be given in 2 divided doses, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

INTERACTIONS → Appendix 1: SSRIs

SIDE-EFFECTS

- **Rare or very rare** Hepatic function abnormal (discontinue)
- **Frequency not known** Bone fracture · glaucoma · hypomania · neuroleptic malignant-like syndrome · withdrawal syndrome neonatal

BREAST FEEDING Present in milk—avoid.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises low initial dose.

RENAL IMPAIRMENT

Dose adjustments EvGr Start with a low dose. M

TREATMENT CESSATION The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients should be counselled about the effects on driving and skilled tasks.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

ANTIDEPRESSANTS › TRICYCLIC ANTIDEPRESSANTS

Amitriptyline hydrochloride

20-Oct-2020

- **INDICATIONS AND DOSE**

Neuropathic pain

- BY MOUTH
- Child 2–11 years: Initially 200–500 micrograms/kg once daily (max. per dose 10 mg), dose to be taken at night, increased if necessary; maximum 1 mg/kg twice daily on specialist advice
- Child 12–17 years: Initially 10 mg once daily, increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice

- **UNLICENSED USE** Not licensed for use in neuropathic pain.
- **CONTRA-INDICATIONS** Arrhythmias · during manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · pyloric stenosis · susceptibility to angle-closure glaucoma · urinary retention
CAUTIONS, FURTHER INFORMATION EvGr Treatment should be stopped if the patient enters a mania phase. M
- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS**
- **Common or very common** Anticholinergic syndrome · drowsiness · QT interval prolongation
- **Frequency not known** Agranulocytosis · alopecia · anxiety · appetite abnormal · arrhythmias · asthenia · bone marrow depression · breast enlargement · cardiac conduction disorders · coma · concentration impaired · confusion · constipation · delirium · delusions · diarrhoea · dizziness · dry mouth · dysarthria · eosinophilia · epigastric distress · face oedema · galactorrhoea · gynaecomastia · hallucination · headache · hepatic disorders · hyperhidrosis · hyperpyrexia · hypertension · hyponatraemia · hypotension · leucopenia · mood altered · movement disorders · mydriasis · myocardial infarction · nausea · neuroleptic malignant syndrome · oral disorders · palpitations · paralytic ileus · peripheral neuropathy · photosensitivity reaction · seizure · sensation abnormal · sexual dysfunction · SIADH · skin reactions · sleep disorders · stroke · sudden cardiac death · suicidal behaviours · syncope · taste altered · testicular swelling · thrombocytopenia · tinnitus · tremor · urinary disorders ·

urinary tract dilation · vision disorders · vomiting · weight changes · withdrawal syndrome

Overdose Overdosage with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdosage may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 944.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Amitriptyline for neuropathic pain www.medicinesforchildren.org.uk/medicines/amitriptyline-for-neuropathic-pain/
  Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
  Effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

- **Amitriptyline hydrochloride (Non-proprietary)**
  Amitriptyline hydrochloride 2 mg per 1 ml Amitriptyline 10mg/5ml oral solution sugar free sugar-free | 150 ml PoM £136.47 DT = £136.47

  Amitriptyline hydrochloride 10 mg per 1 ml Amitriptyline 50mg/5ml oral solution sugar free sugar-free | 150 ml PoM £24.00 DT = £19.20

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- **Amitriptyline hydrochloride (Non-proprietary)**
  Amitriptyline hydrochloride 10 mg Amitriptyline 10mg tablets | 28 tablet PoM £1.50 DT = £0.76
  Amitriptyline hydrochloride 25 mg Amitriptyline 25mg tablets | 28 tablet PoM £1.75 DT = £0.78
  Amitriptyline hydrochloride 50 mg Amitriptyline 50mg tablets | 28 tablet PoM £5.99 DT = £1.14

Doxepin

20-Apr-2021

- **INDICATIONS AND DOSE**
  Depressive illness (particularly where sedation is required)
  - BY MOUTH
  - Child 12–17 years: Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses

- **CONTRA-INDICATIONS** Acute porphyrias p. 688 · during manic phase of bipolar disorder
- **CAUTIONS** Arrhythmias · cardiovascular disease · chronic constipation · diabetes · epilepsy · heart block · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · immediate recovery period after myocardial infarction · patients with significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · susceptibility to angle-closure glaucoma · urinary retention
  CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.
- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS** Agitation · agranulocytosis · alopecia · anticholinergic syndrome · appetite decreased · asthenia · asthma exacerbated · bone marrow depression · breast enlargement · cardiovascular effects · chills · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · eosinophilia · face oedema · flushing · galactorrhoea · gynaecomastia · haemolytic anaemia · hallucination · headache · hyperhidrosis · hyperpyrexia · increased risk of fracture · jaundice · leucopenia · mania · movement disorders · nausea · oral ulceration · paranoid delusions · photosensitivity reaction · postural hypotension · psychosis · seizure · sensation abnormal · sexual dysfunction · SIADH · skin reactions · sleep disorders · suicidal behaviours · tachycardia · taste altered · testicular swelling · thrombocytopenia · tinnitus · tremor · urinary retention · vision blurred · vomiting · weight increased · withdrawal syndrome (in neonates)
  Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 944.
- **PREGNANCY** Use with caution—limited information available.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  Dose adjustments Manufacturer advises consider dose reduction in mild to moderate impairment.
- **RENAL IMPAIRMENT** EvGr Use with caution. M
  Dose adjustments EvGr Consider dose reduction. M
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance

treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).
  Effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Imipramine hydrochloride

10-Nov-2021

- **INDICATIONS AND DOSE**

Nocturnal enuresis

- BY MOUTH
- Child 6–7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- Child 8–10 years: 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- Child 11–17 years: 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

Attention deficit hyperactivity disorder (under expert supervision)

- BY MOUTH
- Child 6–17 years: 10–30 mg twice daily

- **UNLICENSED USE** Not licensed for use for attention deficit hyperactivity disorder.
- **CONTRA-INDICATIONS** Immediate recovery period after myocardial infarction · Acute porphyrias p. 688 · arrhythmia · during the manic phase of bipolar disorder · heart block
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · susceptibility to angle-closure glaucoma · urinary retention

  CAUTIONS, FURTHER INFORMATION EvGr Treatment should be stopped if the patient enters a manic phase. M
- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS**
- **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · cardiac conduction disorders · confusion · delirium · depression · dizziness · drowsiness · epilepsy · hallucination · headache · hepatic disorders · hypotension · mood altered · nausea · palpitations · paraesthesia · sexual dysfunction · skin reactions · sleep disorder · tremor · vomiting · weight changes
- **Uncommon** Psychosis
- **Rare or very rare** Aggression · agranulocytosis · alopecia · bone marrow depression · enlarged mammary gland · eosinophilia · fever · galactorrhoea · gastrointestinal disorders · glaucoma · heart failure · leucopenia · movement disorders · mydriasis · oedema · oral disorders · peripheral vasospastic reaction · photosensitivity reaction · respiratory disorders (frequency not known in neonates) · SIADH · speech disorder · thrombocytopenia
- **Frequency not known** Anticholinergic syndrome · cardiovascular effects · drug fever · hyponatraemia · increased risk of fracture · neurological effects · paranoid delusions exacerbated · psychiatric disorder · suicidal behaviours · tinnitus · urinary disorder · withdrawal symptoms

  Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 944.
- **PREGNANCY** Colic, tachycardia, dyspnoea, irritability, muscle spasms, respiratory depression and withdrawal symptoms reported in neonates when used in the third trimester.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** EvGr Caution in severe impairment. M
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic antidepressants should be withdrawn slowly.

2.4 Psychoses and schizophrenia

Psychoses and related disorders

15-Feb-2021

Overview

There is little information on the efficacy and safety of antipsychotic drugs in children and adolescents and much of the information available has been extrapolated from adult data; in particular, little is known about the long-term effects of antipsychotic drugs at a vulnerable phase of physical growth and development. Antipsychotic drugs should be initiated and managed under the close supervision of an appropriate specialist.

Antipsychotic drugs, formally called 'major tranquillisers', are also known as neuroleptics. They have varying effects and properties; these include sedative, anxiolytic, antimanic, mood stabilising, and antidepressant properties. Antipsychotic drugs are used for a number of mental health disorders, mainly schizophrenia, and mania and hypomania, but may also be used in severe or difficult to treat depression in young people.

Schizophrenia

Psychosis and the specific diagnosis of schizophrenia in children and young people represent a major psychiatric disorder, or cluster of disorders that alters a person's perception, thoughts, mood, and behaviour. The symptoms of psychosis are usually divided into 'positive symptoms' such as hallucinations and delusions, and 'negative symptoms' such as emotional apathy and social withdrawal. Each patient will have a unique combination of symptoms and experiences. Typically, in child and adolescent-onset psychosis and schizophrenia, there is a prodromal period lasting up to 12 months. This is characterised by a deterioration in personal functioning and the onset of transient mild negative symptoms; most children with these symptoms do not go on to develop psychosis or

schizophrenia, although they may be at higher risk of developing psychosis and schizophrenia at a later date.

The initial aim of treatment is to reduce acute phase symptoms and return the child to their baseline level of functioning.

EvGr An oral antipsychotic drug should be offered to children and young patients with schizophrenia in combination with psychological therapy, under specialist supervision. The choice of drug depends on factors such as the potential to cause extrapyramidal symptoms (including akathisia), cardiovascular adverse effects, metabolic adverse effects (including weight gain and diabetes), hormonal adverse effects (including increase in prolactin concentration), and patient and carer preference. Treatment with an antipsychotic drug should be considered an explicit individual therapeutic trial; doses should be started low and slowly titrated up to the minimum effective dose according to patient response and tolerability. Children should receive an antipsychotic drug at optimum dose for 4–6 weeks before it is deemed ineffective.

Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death. It is important to record reasons for continuing, changing, and stopping treatment, and the effects of such changes, including side-effects experienced.

Clozapine p. 279 [unlicensed in children aged under 16 years] can be offered if schizophrenia is not controlled despite the sequential use of at least 2 different antipsychotic drugs, each used for 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, consider other causes of non-response (e.g. adherence to therapy, concurrent use of other drugs), review diagnosis, and check plasma-clozapine concentration before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks' treatment to assess response. A EvGr Children must be registered with a clozapine patient monitoring service. M

Antipsychotic drugs

First-generation antipsychotic drugs

The first-generation antipsychotic drugs (also known as typical or conventional) act predominantly by blocking dopamine D_2 receptors in the brain. They are more likely to cause a range of side-effects, particularly acute extrapyramidal symptoms and hyperprolactinaemia.

First-generation antipsychotics include the **phenothiazine** derivatives (chlorpromazine hydrochloride p. 273, levomepromazine p. 299, pericyazine p. 275, prochlorperazine p. 299, and trifluoperazine p. 276), the **butyrophenones** (haloperidol p. 274), the **diphenylbutylpiperidines** (pimozide p. 275) and the **substituted benzamides** (sulpiride p. 276).

Second-generation antipsychotic drugs

The second-generation antipsychotic drugs (also referred to as atypical) act on a range of receptors in comparison to first-generation antipsychotic drugs and are generally associated with a lower risk for acute extrapyramidal symptoms and tardive dyskinesia; the extent varies between individual drugs. However, second-generation antipsychotic drugs are associated with several other important adverse effects, such as weight gain and glucose intolerance.

Prescribing high-dose antipsychotic drugs

A *high-dose* antipsychotic is defined as a total daily dose of a single antipsychotic drug which exceeds the maximum licensed dose with respect to the age of the patient and the indication being treated, or a total daily dose of two or more antipsychotic drugs which exceeds the maximum licensed dose using the percentage method.

For further information and advice on prescribing high-dose antipsychotic medication, see The Royal College of Psychiatrists consensus statement available at www.rcpsych.ac.uk/.

There is no robust evidence that high doses of antipsychotic drug treatment is any more effective than standard doses for the treatment of schizophrenia. The majority of adverse effects associated with antipsychotic treatment are dose-related and there is clear evidence for a greater side-effect burden with high-dose antipsychotic drug use. Antipsychotic polypharmacy and 'when required' antipsychotic treatment are strongly associated with high-dose prescribing.

Important: When prescribing an antipsychotic for administration in an emergency situation (e.g. for rapid tranquillisation), the aim of treatment is to calm and sedate the patient without inducing sleep. EvGr The initial prescription should be written as a single dose, and not repeated until the effects of the initial dose has been reviewed. Oral and intramuscular drugs should be prescribed separately. The patient must be monitored for side-effects and vital signs at least every hour until there are no further concerns about their physical health status. Monitor the patient every 15 minutes if a high-dose antipsychotic drug has been given. A

Prescribing of antipsychotic drugs in children with learning disabilities

EvGr In children with learning disabilities who are taking antipsychotic drugs and not experiencing psychotic symptoms, the following considerations should be taken into account:

- a reduction in dose or the discontinuation of long-term antipsychotic treatment;
- review of the child's condition after dose reduction or discontinuation of an antipsychotic drug;
- referral to a psychiatrist experienced in working with children who have learning disabilities and mental health problems;
- annual documentation of the reasons for continuing a prescription if the antipsychotic drug is not reduced in dose or discontinued. A

Side-effects and choice of antipsychotic drug

There is little difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 279), and response and tolerability to each antipsychotic drug varies. EvGr There is no first-line antipsychotic drug which is suitable for all children and the properties of individual antipsychotic drugs should be considered and discussed with the child or carers when prescribing. A

Both first-generation and second-generation antipsychotic drugs are associated with side-effects which are common and contribute significantly to non-adherence and treatment discontinuation.

Extrapyramidal symptoms

Extrapyramidal symptoms are dose-related and are most likely to occur with high doses of high-potency first-generation antipsychotics such as the piperazine phenothiazines (trifluoperazine p. 276), and the butyrophenones (haloperidol p. 274). They are less common with some second-generation antipsychotics which have a lower liability for both acute and late onset EPS; particularly clozapine, olanzapine p. 281, quetiapine p. 282, and aripiprazole p. 277. Extrapyramidal symptoms cannot be predicted accurately because they depend on the dose, the class of antipsychotic drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- *parkinsonian symptoms* (including bradykinesia, tremor), which may occur more commonly in females and may appear gradually;
- *dystonia* (uncontrolled muscle spasm in any part of the body), which occurs more commonly in children or young

males; acute dystonia can appear within hours of starting antipsychotics;
- *akathisia* (restlessness), which characteristically occurs within hours to weeks of starting antipsychotic treatment or on dose increase and may be mistaken for psychotic agitation;
- *tardive dyskinesia* (abnormal involuntary movements of lips, tongue, face, and jaw), which can develop on long-term or high-dose therapy, or even after discontinuation; in some patients it can be irreversible.

EvGr When *parkinsonian* symptoms are identified, treatment should be reviewed with the aim of reducing exposure to high-dose and high-potency antipsychotic drugs. Although antimuscarinic drugs can relieve symptom burden, they should not be routinely prescribed for prophylaxis with antipsychotic drugs. A

Tardive dyskinesia is the most serious manifestation of late-onset extrapyramidal symptoms for which there is no satisfactory treatment. EvGr Antipsychotic treatment should be carefully and regularly reviewed; any changes to dose or drug should be made gradually, over weeks or months, to minimise the risk of withdrawal tardive dyskinesia. A However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development.

Hyperprolactinaemia

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin concentration in a dose-dependent manner because it is a dopamine-receptor partial agonist. Risperidone p. 283, amisulpride p. 277, sulpiride p. 276, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. Hyperprolactinaemia is very rare with aripiprazole, clozapine, and quetiapine treatment.

The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, galactorrhoea, and a possible increased risk of breast cancer.

Sexual dysfunction

Sexual dysfunction is reported as a side-effect of all antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha$_1$-adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone, haloperidol and olanzapine have a higher prevalence to cause sexual dysfunction. The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine.

Expert sources advise to consider dose reduction or discontinuation (where appropriate), or switching medication if sexual dysfunction is thought to be antipsychotic-induced.

Cardiovascular side-effects

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide p. 275. Overall risk is probably dose-related but there is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum.

Antipsychotic drugs with a low tendency to prolong QT interval include aripiprazole, clozapine, olanzapine, risperidone, and sulpiride.

Hypotension

Postural hypotension is a common cardiac side-effect of antipsychotics usually presenting acutely during the initial dose titration; however it can be a chronic problem. Postural hypotension can lead to syncope and dangerous falls. The second-generation antipsychotics most likely to cause postural hypotension are clozapine and quetiapine. Slow dose titration is commonly used to minimise postural hypotension.

Hyperglycaemia and diabetes

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is probably increased in children with schizophrenia who take antipsychotic drugs. Some evidence suggests first-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, haloperidol has the lowest risk. Amisulpride and aripiprazole have the lowest risk of diabetes of the second-generation antipsychotic drugs.

Weight gain

There is some concern that children may be more sensitive than adults to the potential of antipsychotic drugs to cause weight gain and metabolic effects. Clozapine and olanzapine commonly cause weight gain. Amisulpride, aripiprazole, haloperidol, sulpiride, and trifluoperazine are least likely to cause weight gain.

Olanzapine is associated with more weight gain than other second-generation antipsychotic drugs. Weight gain happens soon after treatment with olanzapine has started.

Neuroleptic malignant syndrome

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with fever, tachycardia, labile blood pressure, and sweating) is a rare but potentially fatal side-effect of all antipsychotic drugs.

Expert sources advise discontinuation of the antipsychotic drug is essential for at least 5 days, preferably longer. The signs and symptoms of neuroleptic malignant syndrome should be allowed to resolve completely. Bromocriptine and dantrolene have been used for treatment.

Monitoring

Expert sources advise to monitor full blood counts, urea and electrolytes, and liver function test at the start of therapy with antipsychotic drugs, and then yearly thereafter.

EvGr Blood lipids, prolactin concentration, fasting blood glucose and HbA_{1c} should be measured at baseline, at 12 weeks, and then every 6 months thereafter.

Weight should be measured at baseline, weekly during the first 6 weeks, at 12 weeks, and then every 6 months thereafter.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors (e.g. high blood pressure), if there is a personal history of cardiovascular disease, or if the child is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy, at 12 weeks and every 6 months thereafter; A expert sources advise to also monitor blood pressure during dose titration of antipsychotic drugs.

MHRA/CHM advice: Clozapine and other antipsychotics

The MHRA/CHM have released important safety information regarding antipsychotics and monitoring blood concentrations for toxicity. For further information, see *Important safety information* in the amisulpride p. 277, aripiprazole p. 277, clozapine p. 279, olanzapine p. 281, quetiapine p. 282, risperidone p. 283, and sulpiride p. 276 monographs.

ANTIPSYCHOTICS

Antipsychotic drugs

- **CAUTIONS** Blood dyscrasias · cardiovascular disease · conditions predisposing to seizures · depression · diabetes (may raise blood glucose) · epilepsy · history of jaundice · myasthenia gravis · photosensitisation (may occur with higher dosages) · severe respiratory disease · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

- **Cardiovascular disease** An ECG may be required, particularly if physical examination identifies cardiovascular risk factors, personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

- **SIDE-EFFECTS**
- **Common or very common** Agitation · amenorrhoea · arrhythmias · constipation · dizziness · drowsiness · dry mouth · erectile dysfunction · fatigue · galactorrhoea · gynaecomastia · hyperglycaemia · hyperprolactinaemia · hypotension (dose-related) · insomnia · leucopenia · movement disorders · muscle rigidity · neutropenia · parkinsonism · postural hypotension (dose-related) · QT interval prolongation · rash · seizure · tremor · urinary retention · vomiting · weight increased
- **Uncommon** Agranulocytosis · confusion · embolism and thrombosis · neuroleptic malignant syndrome (discontinue—potentially fatal)
- **Rare or very rare** Sudden death · withdrawal syndrome neonatal

Overdose Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning p. 944.

- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. *Animal studies* indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.
- **MONITORING REQUIREMENTS**
- It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
- Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.
- Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.
- **TREATMENT CESSATION** There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.
- **PATIENT AND CARER ADVICE** As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

ANTIPSYCHOTICS › FIRST-GENERATION

F above

Chlorpromazine hydrochloride

21-Oct-2021

- **INDICATIONS AND DOSE**

Childhood schizophrenia and other psychoses (under expert supervision)

- BY MOUTH
- Child 1–5 years: 500 micrograms/kg every 4–6 hours, adjusted according to response; maximum 40 mg per day
- Child 6–11 years: 10 mg 3 times a day, adjusted according to response; maximum 75 mg per day
- Child 12–17 years: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily

Relief of acute symptoms of psychoses (under expert supervision)

- BY DEEP INTRAMUSCULAR INJECTION
- Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
- Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
- Child 12–17 years: 25–50 mg every 6–8 hours

Nausea and vomiting in palliative care (where other drugs have failed or are not available)

- BY MOUTH
- Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
- Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
- Child 12–17 years: 10–25 mg every 4–6 hours
- BY DEEP INTRAMUSCULAR INJECTION
- Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
- Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
- Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

DOSE EQUIVALENCE AND CONVERSION

- For equivalent therapeutic effect 100 mg chlorpromazine base given *rectally* as a suppository ≡ 20–25 mg chlorpromazine hydrochloride *by intramuscular injection* ≡ 40–50 mg of chlorpromazine base or hydrochloride given *by mouth*.

- **CONTRA-INDICATIONS** CNS depression · comatose states · hypothyroidism · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Anxiety · glucose tolerance impaired · mood altered · muscle tone increased
- **Frequency not known** Accommodation disorder · angioedema · atrioventricular block · cardiac arrest · eye

deposit · eye disorders · gastrointestinal disorders · hepatic disorders · hypertriglyceridaemia · hyponatraemia · photosensitivity reaction · respiratory disorders · sexual dysfunction · SIADH · skin reactions · systemic lupus erythematosus (SLE) · temperature regulation disorder · trismus

SPECIFIC SIDE-EFFECTS

- With intramuscular use Nasal congestion

SIDE-EFFECTS, FURTHER INFORMATION Acute dystonic reactions may occur; children are particularly susceptible.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic failure (increased risk of accumulation).
- **RENAL IMPAIRMENT** EvGr Caution in severe renal failure (risk of accumulation). M
- **MONITORING REQUIREMENTS**
- With intramuscular use Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of chlorpromazine hydrochloride in palliative care, see www.medicinescomplete.com/#/content/palliative/antipsychotics.

- **HANDLING AND STORAGE** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, suppository

Haloperidol

19-Jan-2022

- **INDICATIONS AND DOSE**

Nausea and vomiting in palliative care

- BY MOUTH
- Child 12–17 years: 1.5 mg once daily, dose to be taken at night, increased if necessary to 1.5 mg twice daily (max. per dose 5 mg twice daily)
- BY CONTINUOUS INTRAVENOUS INFUSION, OR BY CONTINUOUS SUBCUTANEOUS INFUSION
- Child 1 month–11 years: 25–85 micrograms/kg, to be administered over 24 hours
- Child 12–17 years: 1.5–5 mg, to be administered over 24 hours

Schizophrenia [when alternatives ineffective or not tolerated] (under expert supervision)

- BY MOUTH
- Child 13–17 years: 0.25–1.5 mg twice daily, alternatively 0.16–1 mg 3 times a day, individual benefit-risk should be assessed when considering doses above 3 mg daily; maximum 5 mg per day

Persistent, severe aggression in autism or pervasive developmental disorders [when other treatments ineffective or not tolerated] (under expert supervision)

- BY MOUTH
- Child 6–11 years: 0.25–1.5 mg twice daily, alternatively 0.16–1 mg 3 times a day, the need for continued treatment must be reassessed after a maximum of 6 weeks and regularly thereafter
- Child 12–17 years: 0.25–2.5 mg twice daily, alternatively 0.16–1.6 mg 3 times a day, the need for continued treatment must be reassessed after a maximum of 6 weeks and regularly thereafter

Severe tic disorders, including Tourette's syndrome [when educational, psychological and other pharmacological treatments ineffective] (under expert supervision)

- BY MOUTH
- Child 10–17 years: 0.25–1.5 mg twice daily, alternatively 0.16–1 mg 3 times a day, the need for continued treatment must be reassessed every 6–12 months

Restlessness and confusion in palliative care

- BY MOUTH
- Child 1–17 years: 10–20 micrograms/kg every 8–12 hours

- **UNLICENSED USE** Not licensed for use in palliative care.
- **CONTRA-INDICATIONS** CNS depression · comatose states · congenital long QT syndrome · history of torsade de pointes · history of ventricular arrhythmia · QTc-interval prolongation · recent acute myocardial infarction · uncompensated heart failure · uncorrected hypokalaemia
- **CAUTIONS** Bradycardia · electrolyte disturbances (correct before treatment initiation) · family history of QTc-interval prolongation · history of heavy alcohol exposure · hyperthyroidism · hypotension (including orthostatic hypotension) · prolactin-dependent tumours · prolactinaemia
- **INTERACTIONS** → Appendix 1: haloperidol
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Depression · eye disorders · headache · hypersalivation · nausea · neuromuscular dysfunction · psychotic disorder · vision disorders · weight decreased
- **Uncommon** Breast abnormalities · dyspnoea · gait abnormal · hepatic disorders · hyperhidrosis · menstrual cycle irregularities · muscle complaints · musculoskeletal stiffness · oedema · photosensitivity reaction · restlessness · sexual dysfunction · skin reactions · temperature regulation disorders
- **Rare or very rare** Hypoglycaemia · respiratory disorders · SIADH · trismus
- **Frequency not known** Hypersensitivity vasculitis · pancytopenia · rhabdomyolysis · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- With oral use Angioedema
- With parenteral use Severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Haloperidol is a less sedating antipsychotic.

- **PREGNANCY** Manufacturer advises it is preferable to avoid—moderate amount of data indicate no malformative or fetal/neonatal toxicity, however there are isolated case reports of birth defects following fetal exposure, mostly in

combination with other drugs; reproductive toxicity shown in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
  Dose adjustments Manufacturer advises halve initial dose and then adjust if necessary with smaller increments and at longer intervals.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
  Dose adjustments Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.
- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor electrolytes before treatment initiation and periodically during treatment.
  - EvGr A baseline ECG is recommended before treatment initiation and the need for further ECGs during treatment must be assessed on an individual basis. M
- **PRESCRIBING AND DISPENSING INFORMATION**
  Palliative care For further information on the use of haloperidol in palliative care, see www.medicinescomplete.com/#/content/palliative/haloperidol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

Pericyazine

(Periciazine)

04-May-2021

- **INDICATIONS AND DOSE**

Schizophrenia (under expert supervision) | Psychoses (severe mental or behavioural disorders only) (under expert supervision)

- BY MOUTH
- Child 1–11 years: Initially 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose; maximum 10 mg per day
- Child 12–17 years: Initially 25 mg 3 times a day, increased in steps of 25 mg every week, adjusted according to response, increased if necessary up to 100 mg 3 times a day, total daily dose may alternatively be given in 2 divided doses

- **UNLICENSED USE** Tablets not licensed for use in children.
- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Hypothyroidism
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS** Atrioventricular block · cardiac arrest · consciousness impaired · contact dermatitis · glucose tolerance impaired · hepatic disorders · hyperthermia · nasal congestion · priapism · respiratory depression
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** EvGr Use with caution (risk of accumulation). M

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

  Pericyazine 2.5 mg Pericyazine 2.5mg tablets | 84 tablet PoM £27.90 DT = £27.90
  Pericyazine 10 mg Pericyazine 10mg tablets | 84 tablet PoM £72.00 DT = £72.00

F 273

Pimozide

28-Oct-2021

- **INDICATIONS AND DOSE**

Schizophrenia

- BY MOUTH
- Child 12–17 years (under expert supervision): Initially 1 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily

Tourette syndrome (under expert supervision)

- BY MOUTH
- Child 2–11 years: 1–4 mg daily
- Child 12–17 years: 2–10 mg daily

- **UNLICENSED USE** Not licensed for use in Tourette syndrome.
- **CONTRA-INDICATIONS** CNS depression · comatose states · history of arrhythmias · history or family history of congenital QT prolongation · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: pimozide
- **SIDE-EFFECTS**
  - **Common or very common** Appetite decreased · depression · headache · hyperhidrosis · hypersalivation · restlessness · sebaceous gland overactivity · urinary disorders · vision blurred
  - **Uncommon** Dysarthria · face oedema · muscle spasms · oculogyric crisis · skin reactions
  - **Frequency not known** Cardiac arrest · generalised tonic-clonic seizure · glycosuria · hyponatraemia · libido decreased · neck stiffness · temperature regulation disorders
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** EvGr Caution in renal failure. M
- **MONITORING REQUIREMENTS**
  - ECG monitoring Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also

recommended that patients taking pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, antiarrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2

  Pimozide 4 mg Orap 4mg tablets | 100 tablet PoM £40.31 DT = £40.31

F 273

Sulpiride

21-Oct-2021

- **INDICATIONS AND DOSE**

Schizophrenia with predominantly negative symptoms

- BY MOUTH
- Child 14–17 years (under expert supervision): 200–400 mg twice daily; maximum 800 mg per day

Schizophrenia with mainly positive symptoms

- BY MOUTH
- Child 14–17 years (under expert supervision): 200–400 mg twice daily; maximum 2.4 g per day

Tourette syndrome (under expert supervision)

- BY MOUTH
- Child 2–11 years: 50–400 mg twice daily
- Child 12–17 years: 100–400 mg twice daily

- **UNLICENSED USE** Not licensed for use in Tourette syndrome.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLOZAPINE AND OTHER ANTIPSYCHOTICS: MONITORING BLOOD CONCENTRATIONS FOR TOXICITY (AUGUST 2020)

Following fatal cases involving toxicity of clozapine and other antipsychotic medicines, the MHRA advises that monitoring blood concentration of sulpiride may be helpful in certain circumstances, such as patients presenting symptoms suggestive of toxicity, or when concomitant medicines may interact to increase blood concentration of sulpiride.

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Aggressive patients (even low doses may aggravate symptoms) · agitated patients (even low doses may aggravate symptoms) · excited patients (even low doses may aggravate symptoms)
- **INTERACTIONS** → Appendix 1: sulpiride
- **SIDE-EFFECTS**
- **Common or very common** Breast abnormalities
- **Uncommon** Hypersalivation · muscle tone increased · orgasm abnormal
- **Rare or very rare** Oculogyric crisis
- **Frequency not known** Cardiac arrest · dyspnoea · hyponatraemia · SIADH · trismus · urticaria
- **RENAL IMPAIRMENT**
  Dose adjustments EvGr Reduce dose or increase dose interval; increase in small steps. M
- **MONITORING REQUIREMENTS** Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include lemon and aniseed.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Sulpiride for schizophrenia and Tourette's syndrome www.medicinesforchildren.org.uk/medicines/sulpiride-for-schizophrenia-and-tourettes-syndrome/

F 273

Trifluoperazine

21-Oct-2021

- **INDICATIONS AND DOSE**

Schizophrenia and other psychoses | Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

- BY MOUTH
- Child 12–17 years (under expert supervision): Initially 5 mg twice daily, daily dose may be increased by 5 mg after 1 week. If necessary, dose may be further increased in steps of 5 mg at intervals of 3 days. When satisfactory control has been achieved, reduce gradually until an effective maintenance level has been established

Short-term adjunctive management of severe anxiety

- BY MOUTH
- Child 3–5 years (under expert supervision): Up to 500 micrograms twice daily
- Child 6–11 years (under expert supervision): Up to 2 mg twice daily
- Child 12–17 years (under expert supervision): 1–2 mg twice daily, increased if necessary to 3 mg twice daily

Severe nausea and vomiting unresponsive to other antiemetics

- BY MOUTH
- Child 3–5 years: Up to 500 micrograms twice daily
- Child 6–11 years: Up to 2 mg twice daily
- Child 12–17 years: 1–2 mg twice daily (max. per dose 3 mg twice daily)

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS** Alertness decreased · anxiety · appetite decreased · blood disorder · cardiac arrest · hyperpyrexia · jaundice cholestatic · lens opacity · muscle weakness · oedema · pancytopenia · photosensitivity reaction · skin reactions · thrombocytopenia · urinary hesitation · vision blurred · withdrawal syndrome

  SIDE-EFFECTS, FURTHER INFORMATION Extrapyramidal symptoms are more frequent at doses exceeding 6mg daily. Acute dystonias are more common with potent first

generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

ANTIPSYCHOTICS › SECOND-GENERATION

F 273

Amisulpride

06-Jul-2021

- **DRUG ACTION** Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D_2 and D_3 receptors.

- **INDICATIONS AND DOSE**

Acute psychotic episode in schizophrenia

- BY MOUTH
- Child 15–17 years (under expert supervision): 200–400 mg twice daily, adjusted according to response; maximum 1.2 g per day

Schizophrenia with predominantly negative symptoms

- BY MOUTH
- Child 15–17 years (under expert supervision): 50–300 mg daily

- **UNLICENSED USE** Not licensed for use in children under 18 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLOZAPINE AND OTHER ANTIPSYCHOTICS: MONITORING BLOOD CONCENTRATIONS FOR TOXICITY (AUGUST 2020)

Following fatal cases involving toxicity of clozapine and other antipsychotic medicines, the MHRA advises that monitoring blood concentration of amisulpride may be helpful in certain circumstances, such as patients presenting symptoms suggestive of toxicity, or when concomitant medicines may interact to increase blood concentration of amisulpride.

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma · pre-pubertal children · prolactin-dependent tumours
- **INTERACTIONS** → Appendix 1: antipsychotics, second generation
- **SIDE-EFFECTS**
- **Common or very common** Anxiety · breast pain · hypersalivation · nausea · oculogyric crisis · orgasm abnormal · trismus
- **Frequency not known** Angioedema · bone disorders · cardiac arrest · dyslipidaemia · hyponatraemia · nasal congestion · neoplasms · SIADH · urticaria · vision blurred
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 10 mL/minute (no information available).

Dose adjustments See p. 15.

In adults, manufacturer advises halve dose if creatinine clearance 30–60 mL/minute; use one-third dose if creatinine clearance 10–30 mL/minute (consult product literature).

- **MONITORING REQUIREMENTS** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include caramel.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

F 273

Aripiprazole

17-Aug-2021

- **DRUG ACTION** Aripiprazole is a dopamine D_2 partial agonist with weak 5-HT_{1a} partial agonism and 5-HT_{2A} receptor antagonism.

- **INDICATIONS AND DOSE**

Schizophrenia

- BY MOUTH
- Child 15–17 years (under expert supervision): Initially 2 mg once daily for 2 days, increased to 5 mg once daily for 2 days, then increased to 10 mg once daily, then increased in steps of 5 mg if required; maximum 30 mg per day

Treatment of mania (under expert supervision)

- BY MOUTH
- Child 13–17 years: Initially 2 mg once daily for 2 days, increased to 5 mg once daily for 2 days, then increased to 10 mg once daily, increased in steps of 5 mg if required, maximum duration of treatment 12 weeks, doses above 10 mg daily should only be used in exceptional cases; maximum 30 mg per day continued →

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises double the dose with concurrent use of potent inducers of CYP3A4—no specific recommendation made for children. Manufacturer advises reduce dose by half with concurrent use of potent inhibitors of CYP3A4 or CYP2D6—no specific recommendation made for children.

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an *acute episode* (solution for injection containing aripiprazole 7.5 mg/mL) should **not** be confused with depot preparations (aripiprazole 400-mg vial with solvent), which are usually used in the community or clinics for *maintenance treatment*.

MHRA/CHM ADVICE: CLOZAPINE AND OTHER ANTIPSYCHOTICS: MONITORING BLOOD CONCENTRATIONS FOR TOXICITY (AUGUST 2020)

Following fatal cases involving toxicity of clozapine and other antipsychotic medicines, the MHRA advises that monitoring blood concentration of aripiprazole may be helpful in certain circumstances, such as patients presenting symptoms suggestive of toxicity, or when concomitant medicines may interact to increase blood concentration of aripiprazole.

- **CAUTIONS** Cerebrovascular disease · risk of aspiration pneumonia
- **INTERACTIONS** → Appendix 1: antipsychotics, second generation
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite abnormal · diabetes mellitus · gastrointestinal discomfort · headache · hypersalivation · nausea · vision disorders
  - **Uncommon** Depression · hiccups · sexual dysfunction
  - **Frequency not known** Aggression · alopecia · cardiac arrest · chest pain · diabetic hyperosmolar coma · diabetic ketoacidosis · diarrhoea · dysphagia · generalised tonic-clonic seizure · hepatic disorders · hyperhidrosis · hypertension · hyponatraemia · laryngospasm · musculoskeletal stiffness · myalgia · oropharyngeal spasm · pancreatitis · pathological gambling · peripheral oedema · photosensitivity reaction · pneumonia aspiration · rhabdomyolysis · serotonin syndrome · speech disorder · suicidal behaviours · syncope · temperature regulation disorder · thrombocytopenia · urinary incontinence · weight decreased

  SIDE-EFFECTS, FURTHER INFORMATION Increased incidence of side-effects associated with doses of 30 mg daily; doses above 10 mg daily should only be used in exceptional cases and with close clinical monitoring.
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (oral treatment preferred to intramuscular administration; limited information available).
- **MONITORING REQUIREMENTS** Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- **DIRECTIONS FOR ADMINISTRATION** Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.

Clozapine

04-May-2021

- **DRUG ACTION** Clozapine is a dopamine D_1, dopamine D_2, 5-HT_{2A}, alpha$_1$-adrenoceptor, and muscarinic-receptor antagonist.

- **INDICATIONS AND DOSE**

Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

▸ BY MOUTH

▸ Child 12-17 years (under expert supervision): 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

- **UNLICENSED USE** Not licensed for use in children under 16 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLOZAPINE: REMINDER OF POTENTIALLY FATAL RISK OF INTESTINAL OBSTRUCTION, FAECAL IMPACTION, AND PARALYTIC ILEUS (OCTOBER 2017)

Clozapine has been associated with varying degrees of impairment of intestinal peristalsis—see Cautions and Contra-indications for further information. Patients and their carers should be advised to seek immediate medical advice before taking the next dose of clozapine if constipation develops.

MHRA/CHM ADVICE: CLOZAPINE AND OTHER ANTIPSYCHOTICS: MONITORING BLOOD CONCENTRATIONS FOR TOXICITY (AUGUST 2020)

Following fatal cases involving toxicity of clozapine and other antipsychotic medicines, the MHRA recommends monitoring blood concentration of clozapine for toxicity in certain clinical situations such as when:

- a patient stops smoking or switches to an e-cigarette;
- concomitant medicines may interact to increase blood clozapine levels;
- a patient has pneumonia or other serious infection;
- reduced clozapine metabolism is suspected;
- toxicity is suspected.

Clozapine blood concentration monitoring should be carried out in addition to the required blood tests to manage the risk of agranulocytosis.

- **CONTRA-INDICATIONS** Alcoholic and toxic psychoses · bone-marrow disorders · coma · drug intoxication · history of agranulocytosis · history of circulatory collapse · history of neutropenia · paralytic ileus · severe cardiac disorders (e.g. myocarditis) · severe CNS depression · uncontrolled epilepsy

- **CAUTIONS** Susceptibility to angle-closure glaucoma · taper off other antipsychotics before starting

CAUTIONS, FURTHER INFORMATION

▸ Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000 /mm^3 or if absolute neutrophil count below 1500 /mm^3 discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.

▸ Myocarditis and cardiomyopathy Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

- Perform physical examination and take full medical history before starting
- Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
- Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
- If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
- Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

▸ Intestinal obstruction Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

- **INTERACTIONS** → Appendix 1: antipsychotics, second generation

- **SIDE-EFFECTS**

▸ **Common or very common** Appetite decreased · eosinophilia · fever · headache · hypertension · leucocytosis · nausea · oral disorders · speech impairment · sweating abnormal · syncope · temperature regulation disorders · urinary disorders · vision blurred

▸ **Uncommon** Fall

▸ **Rare or very rare** Anaemia · cardiac arrest · cardiac inflammation · cardiomyopathy · circulatory collapse · delirium · diabetes mellitus · dyslipidaemia · dysphagia · gastrointestinal disorders · glucose tolerance impaired · hepatic disorders · increased risk of infection · intestinal obstruction (including fatal cases) · ketoacidosis · nephritis tubulointerstitial · obsessive-compulsive disorder · pancreatitis · pericardial effusion · respiratory disorders · restlessness · sexual dysfunction · skin reactions · sleep apnoea · thrombocytopenia · thrombocytosis

▸ **Frequency not known** Angina pectoris · angioedema · chest pain · cholinergic syndrome · diarrhoea · gastrointestinal discomfort · hypersensitivity vasculitis · mitral valve incompetence · muscle complaints · muscle weakness · myocardial infarction · nasal congestion · palpitations · polyserositis · pseudophaeochromocytoma · renal failure · rhabdomyolysis · sepsis · systemic lupus erythematosus (SLE)

SIDE-EFFECTS, FURTHER INFORMATION Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor liver function (discontinue if liver enzymes are greater than 3 times the upper limit of normal or jaundice occurs); avoid in symptomatic or progressive impairment and in hepatic failure.

- **RENAL IMPAIRMENT** EvGr Avoid in severe impairment. ◈

- **MONITORING REQUIREMENTS**
  - Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
  - Blood clozapine concentration should be monitored in certain clinical situations—consult product literature.
  - Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
  - Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
  - Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months' treatment, then every 4–6 months.
  - Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.
- **TREATMENT CESSATION** On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water. Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed.
- **PRESCRIBING AND DISPENSING INFORMATION** Clozapine has been used for psychosis in Parkinson's disease in children aged 16 years and over.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clozapine oral suspension and orodispersible tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Lurasidone hydrochloride

08-Jul-2021

- **DRUG ACTION** Lurasidone is a dopamine D_2, 5-HT_{2A}, 5-HT_7, alpha$_{2A}$- and alpha$_{2C}$- adrenoceptor antagonist, and is a partial agonist at 5-HT_{1a} receptors.

- **INDICATIONS AND DOSE**

Schizophrenia

- BY MOUTH
- Child 13–17 years: Initially 37 mg once daily, increased if necessary up to 74 mg once daily, treatment should be prescribed by a specialist

Schizophrenia [when given with moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)]

- BY MOUTH
- Child 13–17 years: Initially 18.5 mg once daily (max. per dose 74 mg once daily), treatment should be prescribed by a specialist

- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: antipsychotics, second generation
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite abnormal · asthenia · concentration impaired · depression · headaches · hyperhidrosis · irritability · nausea · oculogyric crisis · oral disorders · psychotic disorder · sleep disorders · weight decreased
  - **Uncommon** Aggression · alopecia · arthralgia · autoimmune thyroiditis · breast pain · chills · diarrhoea · dyspnoea · fever · gait abnormal · gastrointestinal discomfort · hair growth abnormal · hallucinations · hyperacusia · hyperandrogenism · hyperinsulinaemia · hypertension · hypothyroidism · increased risk of infection · malaise · memory impairment · menstrual cycle irregularities · muscle complaints · musculoskeletal stiffness · oropharyngeal pain · pain · palpitations · paraesthesia · perception altered · psychiatric disorders · renal disorder · sexual dysfunction · suicidal behaviours · taste altered · urinary disorders · urine abnormalities · urticaria · vision disorders
- **PREGNANCY** EvGr Use only if potential benefit outweighs risk—limited information available. Ⓜ
- **BREAST FEEDING** EvGr Use only if potential benefit outweighs risk—present in milk in *animal* studies. Ⓜ
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).
  Dose adjustments Manufacturer advises initially 18.5 mg once daily in moderate to severe impairment, increased if necessary up to 74 mg once daily in moderate impairment, or up to max. 37 mg once daily in severe impairment.
- **RENAL IMPAIRMENT** EvGr Use only if potential benefit outweighs risk if creatinine clearance less than 15 mL/minute. Ⓜ

Dose adjustments EvGr Initially 18.5 mg once daily, up to max. 74 mg once daily if creatinine clearance less than 50 mL/minute, Ⓜ see p. 15.

Olanzapine

13-Apr-2021

● **DRUG ACTION** Olanzapine is a dopamine D_1, D_2, D_4, 5-HT_2, histamine- 1-, and muscarinic-receptor antagonist.

● **INDICATIONS AND DOSE**

Schizophrenia | Combination therapy for mania

▸ BY MOUTH

▸ Child 12-17 years (under expert supervision): Initially 5–10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. females, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Monotherapy for mania

▸ BY MOUTH

▸ Child 12-17 years (under expert supervision): 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. females, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

● **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLOZAPINE AND OTHER ANTIPSYCHOTICS: MONITORING BLOOD CONCENTRATIONS FOR TOXICITY (AUGUST 2020)

Following fatal cases involving toxicity of clozapine and other antipsychotic medicines, the MHRA advises that monitoring blood concentration of olanzapine may be helpful in certain circumstances, such as patients presenting symptoms suggestive of toxicity, or when concomitant medicines may interact to increase blood concentration of olanzapine.

● **CAUTIONS** Bone-marrow depression · hypereosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus

● **INTERACTIONS** → Appendix 1: antipsychotics, second generation

● **SIDE-EFFECTS**

▸ **Common or very common** Anticholinergic syndrome · appetite increased · arthralgia · asthenia · eosinophilia · fever · glycosuria · hypersomnia · oedema · sexual dysfunction

▸ **Uncommon** Abdominal distension · alopecia · breast enlargement · diabetes mellitus · diabetic coma · dysarthria · epistaxis · ketoacidosis · memory loss · oculogyration · photosensitivity reaction · urinary disorders

▸ **Rare or very rare** Hepatic disorders · hypothermia · pancreatitis · rhabdomyolysis · thrombocytopenia

● **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.

● **BREAST FEEDING** Avoid—present in milk.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.
Dose adjustments In adults, manufacturer advises consider initial dose reduction—consult product literature.

● **RENAL IMPAIRMENT**
Dose adjustments In adults, manufacturer advises consider initial dose reduction (consult product literature).

● **MONITORING REQUIREMENTS**

▸ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

▸ Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one months' treatment, then every 4–6 months.

Quetiapine

09-Sep-2020

- **DRUG ACTION** Quetiapine is a dopamine D_1, dopamine D_2, 5-HT_2, alpha$_1$-adrenoceptor, and histamine-1 receptor antagonist.

- **INDICATIONS AND DOSE**

Schizophrenia

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years (under expert supervision): Initially 25 mg twice daily, adjusted according to response. adjusted in steps of 25–50 mg; maximum 750 mg per day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years (under expert supervision): Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily, usual dose 400–800 mg once daily; maximum 800 mg per day

Treatment of mania in bipolar disorder

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years (under expert supervision): 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then 200 mg twice daily for day 5, then adjusted in steps of up to 100 mg daily, adjusted according to response, usual dose 400–600 mg daily in 2 divided doses

DOSE EQUIVALENCE AND CONVERSION

- Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLOZAPINE AND OTHER ANTIPSYCHOTICS: MONITORING BLOOD CONCENTRATIONS FOR TOXICITY (AUGUST 2020)

Following fatal cases involving toxicity of clozapine and other antipsychotic medicines, the MHRA advises that monitoring blood concentration of quetiapine may be helpful in certain circumstances, such as patients presenting symptoms suggestive of toxicity, or when concomitant medicines may interact to increase blood concentration of quetiapine.

- **CAUTIONS** Cerebrovascular disease · patients at risk of aspiration pneumonia · treatment of depression in patients under 25 years (increased risk of suicide)
- **INTERACTIONS** → Appendix 1: antipsychotics, second generation
- **SIDE-EFFECTS**
- **Common or very common** Appetite increased · asthenia · dysarthria · dyspepsia · dyspnoea · fever · headache · irritability · palpitations · peripheral oedema · rhinitis · sleep disorders · suicidal behaviour (particularly on initiation) · suicidal ideation (particularly on initiation) · syncope · vision blurred · withdrawal syndrome

Risperidone

13-Apr-2021

● **DRUG ACTION** Risperidone is a dopamine D_2, 5-HT_{2A}, alpha$_1$-adrenoceptor, and histamine-1 receptor antagonist.

● **INDICATIONS AND DOSE**

Acute and chronic psychosis

- BY MOUTH
- Child 12–17 years (under expert supervision): 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower titration is appropriate in some patients; usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day

Short-term monotherapy of mania in bipolar disorder (under expert supervision)

- BY MOUTH
- Child 12–17 years: Initially 500 micrograms once daily, then adjusted in steps of 0.5–1 mg daily, adjusted according to response; usual dose 2.5 mg daily in 1–2 divided doses; maximum 6 mg per day

Short-term treatment (up to 6 weeks) of persistent aggression in conduct disorder (under expert supervision)

- BY MOUTH
- Child 5–17 years (body-weight up to 50 kg): Initially 250 micrograms once daily, then increased in steps of 250 micrograms once daily on alternate days, adjusted according to response; usual dose 500 micrograms once daily; maximum 750 micrograms per day
- Child 5–17 years (body-weight 50 kg and above): Initially 500 micrograms once daily, then increased in steps of 500 micrograms once daily on alternate days, adjusted according to response; usual dose 1 mg once daily; maximum 1.5 mg per day

Short-term treatment of severe aggression in autism (under expert supervision)

- BY MOUTH
- Child 5–17 years (body-weight 15–20 kg): Initially 250 micrograms daily for at least 4 days, then increased if necessary to 500 micrograms daily, then increased in steps of 250 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any side-effects after 3–4 weeks; stop if no response at 6 weeks; maximum 1 mg per day
- Child 5–17 years (body-weight 20–45 kg): Initially 500 micrograms daily for at least 4 days, then increased if necessary to 1 mg daily, then increased in steps of 500 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any side-effects after 3–4 weeks; stop if no response at 6 weeks; maximum 2.5 mg per day
- Child 5–17 years (body-weight 45 kg and above): Initially 500 micrograms daily for at least 4 days, then increased if necessary to 1 mg daily, then increased in steps of 500 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any

continued →

side-effects after 3–4 weeks; stop if no response at 6 weeks; maximum 3 mg per day

- **UNLICENSED USE** Not licensed for use in children for psychosis, mania, or autism.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Risperidone has been confused with ropinirole; care must be taken to ensure the correct drug is prescribed and dispensed.

MHRA/CHM ADVICE: CLOZAPINE AND OTHER ANTIPSYCHOTICS: MONITORING BLOOD CONCENTRATIONS FOR TOXICITY (AUGUST 2020)

Following fatal cases involving toxicity of clozapine and other antipsychotic medicines, the MHRA advises that monitoring blood concentration of risperidone may be helpful in certain circumstances, such as patients presenting symptoms suggestive of toxicity, or when concomitant medicines may interact to increase blood concentration of risperidone.

- **CAUTIONS** Avoid in Acute porphyrias p. 688 · cataract surgery (risk of intra-operative floppy iris syndrome) · dehydration · family history of sudden cardiac death (perform ECG) · prolactin-dependent tumours
- **INTERACTIONS** → Appendix 1: antipsychotics, second generation
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite abnormal · asthenia · chest discomfort · conjunctivitis · cough · depression · diarrhoea · dyspnoea · epistaxis · fall · fever · gastrointestinal discomfort · headache · hypertension · increased risk of infection · joint disorders · laryngeal pain · muscle spasms · nasal congestion · nausea · oedema · oral disorders · pain · skin reactions · sleep disorders · urinary disorders · vision disorders
  - **Uncommon** Alopecia · anaemia · breast abnormalities · cardiac conduction disorders · cerebrovascular insufficiency · chills · coma · concentration impaired · consciousness impaired · cystitis · diabetes mellitus · dry eye · dysarthria · dysphagia · dysphonia · ear pain · eye disorders · feeling abnormal · flushing · gait abnormal · gastrointestinal disorders · malaise · menstrual cycle irregularities · mood altered · muscle weakness · palpitations · polydipsia · posture abnormal · procedural pain · respiratory disorders · sensation abnormal · sexual dysfunction · syncope · taste altered · thirst · thrombocytopenia · tinnitus · vaginal discharge · vertigo · weight decreased
  - **Rare or very rare** Angioedema · dandruff · diabetic ketoacidosis · eyelid crusting · glaucoma · hypoglycaemia · hypothermia · induration · jaundice · pancreatitis · peripheral coldness · rhabdomyolysis · SIADH · sleep apnoea · water intoxication · withdrawal syndrome
  - **Frequency not known** Cardiac arrest · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—small amount present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
  Dose adjustments Manufacturer advises dose reduction to half the usual dose, and slower dose titration.
- **RENAL IMPAIRMENT** EvGr Use with caution. Ⓜ
  Dose adjustments EvGr Initial and subsequent doses should be halved, with slower dose titration. Ⓜ
- **DIRECTIONS FOR ADMINISTRATION** Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Manufacturer advises oral liquid may be diluted with any non-alcoholic drink, except tea.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risperidone orodispersible tablets and oral liquid (counselling on use of dose syringe advised).

3 Movement disorders

Cerebral palsy and spasticity

18-Jan-2022

Description of condition

Cerebral palsy is a group of permanent, non-progressive abnormalities of the developing fetal or neonatal brain that lead to movement and posture disorders, causing activity limitation and functional impact. There can be accompanying clinical and developmental comorbidities. These include disturbances of sensation, perception, cognition, communication and behaviour, epilepsy, and secondary musculoskeletal problems (such as muscle contracture and abnormal torsion). Cerebral palsy is not curable and the comorbidities can impact on many areas of participation and quality of life, particularly eating, drinking, comfort, and sleep.

Spasticity

Spasticity in children is most commonly associated with cerebral palsy, but can also be associated with other non-progressive brain disorders.

Aims of treatment

Treatment involves managing spasticity to optimise movement and posture, while minimising potential secondary musculoskeletal deformity, as well as managing developmental and clinical comorbidities.

Non-drug treatment

EvGr All children with spasticity should be offered physiotherapy and, where necessary, occupational therapy. They can also benefit from orthoses.

Orthopaedic surgery can be used, as an adjunct to other interventions, to prevent deterioration and improve function. A

Drug treatment

Spasticity

EvGr Oral diazepam p. 249 or oral baclofen p. 741 can be used to treat discomfort, pain, muscle spasm and functional disability. If oral diazepam is initially used because of its rapid onset of action, consider changing to oral baclofen if a sustained, longer duration of effect is required or if long-term treatment is necessary. If the response to diazepam or baclofen after 4–6 weeks is unsatisfactory, a trial of combined treatment using both drugs can be considered. Consider reducing the dose if adverse effects such as drowsiness occur. Treatment cessation should be considered when management is reviewed and at least every six months.

If **dystonia** is considered to contribute significantly to problems with posture, function and pain, a trial of treatment with oral trihexyphenidyl hydrochloride p. 287, levodopa, or baclofen [unlicensed indications] can be considered.

Treatment with botulinum toxin type A p. 288 [unlicensed under 2 years] should be considered for those in whom focal spasticity of the upper or lower limbs is inhibiting fine motor function, affecting care and hygiene, causing pain or disturbing sleep, impeding tolerance of other treatments (such as orthoses), or causing cosmetic concerns. A trial of botulinum toxin type A treatment can also be considered in those with spasticity when *focal dystonia*[unlicensed] is causing problems, such as postural or functional difficulties or pain. Ongoing assessment of muscle tone, range of movement and motor function is required. Botulinum toxin type A treatment should **not** be offered to children receiving treatment with Aminoglycosides p. 351.

Treatment with intrathecal baclofen [unlicensed under 4 years] (administered by continuous pump) can be considered in children with spasticity if (despite the use of non-invasive treatments) spasticity or dystonia are causing difficulties with pain, muscle spasm, posture, function or self-care. Before deciding to implant the intrathecal baclofen pump, an intrathecal baclofen test should be performed to assess the therapeutic effect and to check for adverse effects. A

Developmental and clinical comorbidities

EvGr Regular assessment and appropriate nutritional support should be provided, especially if there are concerns about oral intake, growth or nutritional status. Enteral tube feeding can be provided if oral intake is insufficient to provide adequate nutrition. A

Children with cerebral palsy are likely to have risk factors for low bone mineral density and can have an increased risk of low-impact fractures. EvGr Calcium and vitamin D supplementation (such as colecalciferol with calcium carbonate p. 721) may be required. Children with reduced bone density and a history of low-impact fracture can be considered for bisphosphonate therapy (under specialist guidance). A

Pain is common in children with cerebral palsy, especially those with more severe motor impairment. Condition-specific causes of pain and discomfort include musculoskeletal problems (for example, scoliosis, hip subluxation and dislocation), increased muscle tone (including dystonia and spasticity), muscle fatigue and immobility, constipation, vomiting, and gastro-oesophageal reflux disease. Reversible causes of pain should be treated as appropriate, see *Spasticity* (above), Constipation p. 41, Gastro-oesophageal reflux disease p. 64, Urinary frequency, enuresis and incontinence p. 554, Nocturnal enuresis in children p. 554, and Urinary-tract infections p. 424.

Other types of pain include non-specific back pain, headache, non-specific abdominal pain, dental pain and dysmenorrhoea. EvGr Initially, a 'stepped approach' trial of simple analgesia (such as paracetamol p. 302, ibuprofen p. 747, or both) for mild-to-moderate pain can be considered. If such a trial is unsuccessful, the child should be referred to a specialist pain team. A

In children with cerebral palsy, sleep disturbances are common. EvGr If no treatable cause is found, a trial of melatonin p. 328 [unlicensed] can be considered to manage sleep disturbances, particularly for problems with falling asleep. Regular sedative medication should **not** be used to manage primary sleep disorders in children with cerebral palsy without seeking specialist advice. A

Epilepsy can be associated with cerebral palsy; for its management, see Epilepsy p. 211.

Children with cerebral palsy are at greater risk of mental health problems, in comparison with the general age comparison population. For management of these conditions, see Depression p. 263, Anxiety (Hypnotics and anxiolytics p. 327), and Attention deficit hyperactivity disorder p. 253.

Drooling

EvGr Drooling can be managed with an antimuscarinic drug, such as glycopyrronium bromide p. 922 [unlicensed in under 3 years] (oral or by enteral tube) or hyoscine hydrobromide p. 297 [unlicensed] (transdermal). For children with dyskinetic cerebral palsy, trihexyphenidyl hydrochloride [unlicensed] can be used (on specialist advice). If antimuscarinic drugs provide insufficient benefit or are not tolerated, botulinum toxin type A injections to the salivary glands can be considered. High-dose botulinum toxin type A injections to the salivary glands can, rarely, cause breathing and swallowing difficulties, which requires urgent hospital admission. Surgery can be an option in cases resistant to drug treatment. A

Related drugs

Other drugs used for Cerebral palsy and spasticity: co-careldopa p. 287, dantrolene sodium p. 933.

Transition planning

For guidance on the patient's transition from paediatric to adult services, see *Transitional services for chronic conditions* in Guidance on prescribing p. 1.

3.1 Dystonias and other involuntary movements

Dystonias and related disorders

Dystonias

Dystonias may result from conditions such as cerebral palsy or may be related to a deficiency of the neurotransmitter dopamine as in Segawa syndrome.

Dopaminergic drugs used in dystonias

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral **dopa-decarboxylase inhibitor**, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitor most commonly used in children is carbidopa (in co-careldopa p. 287).

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual child.

In severe dystonias related to cerebral palsy, improvement can be expected within 2 weeks. Children with Segawa syndrome are particularly sensitive to levodopa; they may even become symptom free on small doses. Levodopa also has a role in treating metabolic disorders such as defects in tetrahydrobiopterin synthesis and dihydrobiopterin reductase deficiency. Tetrahydrobiopterin may have a role in metabolic disorders.

Children may experience nausea within 2 hours of taking a dose; nausea and vomiting with co-careldopa is rarely dose-limiting.

In dystonic cerebral palsy, treatment with larger doses of levodopa is associated with the development of potentially troublesome motor complications (including response fluctuations and dyskinesias). Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'off' period.

Antimuscarinic drugs used in dystonias

The antimuscarinic drugs procyclidine hydrochloride below and trihexyphenidyl hydrochloride p. 287 reduce the symptoms of dystonias, including those induced by antipsychotic drugs; there is no justification for giving them routinely in the absence of dystonic symptoms. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

There are no important differences between the antimuscarinic drugs, but some children tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 249 can be given for life-threatening acute drug-induced dystonic reactions.

Drugs used in essential tremor, chorea, tics, and related disorders

Haloperidol p. 274 can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 275 [unlicensed indication] (**important**: ECG monitoring required), and sulpiride p. 276 [unlicensed indication].

Propranolol hydrochloride p. 116 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremor associated with anxiety or thyrotoxicosis.

Botulinum toxin type A p. 288 should be used under specialist supervision. Treatment with botulinum toxin type A can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties, and in children with spasticity in whom focal dystonia causes postural or functional difficulties or pain.

ANTIMUSCARINICS

Procyclidine hydrochloride

27-Apr-2021

- **DRUG ACTION** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

- **INDICATIONS AND DOSE**

Acute dystonia

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Child 1 month–1 year: 0.5–2 mg for 1 dose, dose usually effective in 5–10 minutes but may need 30 minutes for relief
  - Child 2–9 years: 2–5 mg for 1 dose, dose usually effective in 5–10 minutes but may need 30 minutes for relief
  - Child 10–17 years: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief

Dystonia

- BY MOUTH
  - Child 7–11 years: 1.25 mg 3 times a day
  - Child 12–17 years: 2.5 mg 3 times a day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Gastro-intestinal obstruction
- **CAUTIONS** Cardiovascular disease · hypertension · liable to abuse · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: procyclidine
- **SIDE-EFFECTS**
  - **Common or very common** Constipation · dry mouth · urinary retention · vision blurred
  - **Uncommon** Anxiety · cognitive impairment · confusion · dizziness · gingivitis · hallucination · memory loss · nausea · rash · vomiting
  - **Rare or very rare** Psychotic disorder
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** EvGr Use with caution. Ⓜ
- **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

- **Procyclidine hydrochloride (Non-proprietary)**

Procyclidine hydrochloride 5 mg per 1 ml Procyclidine 10mg/2ml solution for injection ampoules | 5 ampoule PoM £72.50-£93.12 DT = £84.66

Oral solution

- **Procyclidine hydrochloride (Non-proprietary)**
  Procyclidine hydrochloride 500 microgram per 1 ml Procyclidine 2.5mg/5ml oral solution sugar free sugar-free | 150 ml PoM £37.39 DT = £37.39
  Procyclidine hydrochloride 1 mg per 1 ml Procyclidine 5mg/5ml oral solution sugar free sugar-free | 150 ml PoM £55.61 DT = £55.61

Tablet

- **Procyclidine hydrochloride (Non-proprietary)**
  Procyclidine hydrochloride 5 mg Procyclidine 5mg tablets | 28 tablet PoM £12.65 DT = £1.26 | 100 tablet PoM £4.50–£8.94 | 500 tablet PoM £22.50–£44.63
- **Kemadrin** (Aspen Pharma Trading Ltd)
  Procyclidine hydrochloride 5 mg Kemadrin 5mg tablets | 100 tablet PoM £4.72 | 500 tablet PoM £23.62

Trihexyphenidyl hydrochloride

27-Apr-2021

(Benzhexol hydrochloride)

- **DRUG ACTION** Trihexyphenidyl exerts its effects by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

- **INDICATIONS AND DOSE**

Dystonia

- BY MOUTH
- Child 3 months–17 years: Initially 1–2 mg daily in 1–2 divided doses, then increased in steps of 1 mg every 3–7 days, dose to be adjusted according to response and side-effects; maximum 2 mg/kg per day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Myasthenia gravis
- **CAUTIONS** Cardiovascular disease · gastro-intestinal obstruction · hypertension · liable to abuse · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: trihexyphenidyl
- **SIDE-EFFECTS** Anxiety · bronchial secretion decreased · confusion · constipation · delusions · dizziness · dry mouth · dysphagia · euphoric mood · fever · flushing · hallucination · insomnia · memory loss · myasthenia gravis aggravated · mydriasis · nausea · skin reactions · tachycardia · thirst · urinary disorders · vision disorders · vomiting
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** EvGr Use with caution. M
- **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets should be taken with or after food.

DOPAMINERGIC DRUGS › DOPAMINE PRECURSORS

Co-careldopa

06-Aug-2021

- **INDICATIONS AND DOSE**

Dopamine-sensitive dystonias including Segawa syndrome and dystonias related to cerebral palsy (dose expressed as levodopa)

- BY MOUTH
- Child 3 months–17 years: Initially 250 micrograms/kg 2–3 times a day, dose to be increased according to response every 2–3 days, increased if necessary up to 1 mg/kg 3 times a day, preparation containing 1:4 ratio of carbidopa:levodopa is to be used

Treatment of defects in tetrahydrobiopterin synthesis and dihydrobiopterin reductase deficiency (dose expressed as levodopa)

- BY MOUTH
- Neonate: Initially 250–500 micrograms/kg 4 times a day, dose to be increased every 4–5 days according to response, a preparation containing 1:4 carbidopa:levodopa to be administered; maintenance 2.5–3 mg/kg 4 times a day, at higher doses consider preparation containing 1:10 carbidopa:levodopa, review regularly (every 3–6 months).
- Child: Initially 250–500 micrograms/kg 4 times a day, dose to be increased every 4–5 days according to response, a preparation containing 1:4 carbidopa:levodopa to be administered; maintenance 2.5–3 mg/kg 4 times a day, at higher doses consider preparation containing 1:10 carbidopa:levodopa, review regularly (every 3–6 months in early childhood)

DOSE EQUIVALENCE AND CONVERSION

- The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
- 2 tablets *Sinemet*® 12.5 mg/50 mg is equivalent to 1 tablet *Sinemet*® Plus 25 mg/100 mg.

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Cardiovascular disease · diabetes mellitus · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · history of skin melanoma (risk of activation) · osteomalacia · psychiatric illness (avoid if severe and discontinue if deterioration) · pulmonary disease · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: carbidopa · levodopa
- **SIDE-EFFECTS**
- **Rare or very rare** Drowsiness · seizure · sleep disorders
- **Frequency not known** Agranulocytosis · alertness decreased · alopecia · anaemia · angioedema · anxiety · appetite decreased · asthenia · cardiac disorder · chest pain · compulsions · confusion · constipation · delusions · depression · diarrhoea · dizziness · dry mouth · dyskinesia (may be dose-limiting) · dysphagia · dyspnoea · eating disorders · euphoric mood · eye disorders · fall · focal tremor · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · haemolytic anaemia · hallucination · headache · Henoch-Schönlein purpura · hiccups · hoarseness · Horner's syndrome exacerbated · hypertension · hypotension · leucopenia · malaise · malignant melanoma · movement

disorders · muscle complaints · nausea · neuroleptic malignant syndrome (on abrupt discontinuation) · oedema · oral disorders · palpitations · pathological gambling · postural disorders · psychotic disorder · respiration abnormal · sensation abnormal · sexual dysfunction · skin reactions · suicidal ideation · sweat changes · syncope · taste bitter · teeth grinding · thrombocytopenia · trismus · urinary disorders · urine dark · vasodilation · vision disorders · vomiting · weight changes

- **PREGNANCY** Use with caution—toxicity has occurred in *animal* studies.
- **BREAST FEEDING** May suppress lactation; present in milk—avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in hepatic disease.
- **MONITORING REQUIREMENTS** In prolonged therapy, psychiatric, hepatic, haematological, renal, and cardiovascular monitoring is advisable; warn patients to resume normal activities gradually.
- **EFFECT ON LABORATORY TESTS** False positive tests for urinary ketones have been reported.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
- **PATIENT AND CARER ADVICE** Warn patients to resume normal activity gradually.

  Driving and skilled tasks **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

  Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

  Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 14

MUSCLE RELAXANTS › PERIPHERALLY ACTING › NEUROTOXINS (BOTULINUM TOXINS)

Botulinum toxin type A

12-Apr-2022

- **INDICATIONS AND DOSE**

  Dynamic equinus foot deformity caused by spasticity in ambulant paediatric cerebral palsy (specialist use only) | **Upper limb spasticity in paediatric cerebral palsy (specialist use only)**
  - BY INTRAMUSCULAR INJECTION
  - Child 2–17 years: (consult product literature)

  Chronic sialorrhoea [due to neurological or neurodevelopmental disorders] (specialist use only)
  - BY LOCAL INFILTRATION
  - Child 2–17 years (body-weight 12 kg and above): (consult product literature)

  DOSE EQUIVALENCE AND CONVERSION
  - **Important**: information is specific to each individual preparation.

- **CONTRA-INDICATIONS** Infection at injection site
- **CAUTIONS** Atrophy in target muscle · chronic respiratory disorder · excessive weakness in target muscle · history of aspiration · history of dysphagia · inflammation in target muscle · neurological disorders · neuromuscular disorders · off-label use (fatal adverse events reported)

  CAUTIONS, FURTHER INFORMATION Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.
- **INTERACTIONS** → Appendix 1: botulinum toxins
- **SIDE-EFFECTS**
  - **Common or very common** Alopecia · asthenia · autonomic dysreflexia · bladder diverticulum · constipation · dizziness · drowsiness · dry eye · dry mouth · dysphagia (most common after injection into sternocleidomastoid muscle and salivary gland) · ecchymosis (minimised by applying gentle pressure at injection site immediately after injection) · eye discomfort · eye disorders · eye inflammation · fall · fever · gait abnormal · haematuria · headaches · hot flush · increased risk of infection · influenza like illness · insomnia · joint disorders · leukocyturia · malaise · muscle complaints · muscle weakness · musculoskeletal stiffness · nausea · neuromuscular dysfunction · oedema · pain · paresis · sensation abnormal · skin reactions · subcutaneous nodule · urinary disorders · vision disorders
  - **Uncommon** Anxiety · coordination abnormal · depression · dysphonia · dyspnoea · facial paralysis · memory loss · oral disorders · photosensitivity reaction · postural hypotension · speech impairment · taste altered · vertigo
  - **Frequency not known** Abdominal pain · angioedema · angle closure glaucoma · appetite decreased · arrhythmia · diarrhoea · hearing impairment · hypersensitivity · myocardial infarction · myopathy · nerve disorders · respiratory disorders · seizure · syncope · tinnitus · vomiting
- **CONCEPTION AND CONTRACEPTION** Avoid in women of child-bearing age unless using effective contraception.
- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies (manufacturer of *Botox*® advise avoid).

- **BREAST FEEDING** Low risk of systemic absorption but avoid unless essential.
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations are not interchangeable.
- **PATIENT AND CARER ADVICE** Patients and carers should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

  Botulinum toxin type A 200 unit Xeomin 200unit powder for solution for injection vials | 1 vial PoM £259.80 (Hospital only)

4 Nausea and labyrinth disorders

Nausea and labyrinth disorders

01-Oct-2021

Drug treatment

Antiemetics are generally only prescribed when the cause of vomiting is known because otherwise, they may delay diagnosis, particularly in children. If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines (e.g. cinnarizine p. 296, cyclizine p. 290, promethazine hydrochloride p. 195, promethazine teoclate p. 297) are effective against nausea and vomiting resulting from many underlying conditions. The duration of action and incidence of adverse effects, such as drowsiness and antimuscarinic effects, differ between antihistamines.

The phenothiazines (e.g. chlorpromazine hydrochloride p. 273, prochlorperazine p. 299, trifluoperazine p. 276) are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. Severe dystonic reactions sometimes occur with phenothiazines, especially in children. Prochlorperazine is less sedating and available as a buccal tablet for children aged 12 years and over, which can be useful in patients with persistent vomiting or with severe nausea.

EvGr Other antipsychotic drugs including haloperidol p. 274 [unlicensed use] and levomepromazine p. 299 are used for the relief of nausea and vomiting in palliative care. A For information on the use of antiemetics in palliative care, see Prescribing in palliative care p. 19.

Metoclopramide hydrochloride p. 292 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastric smooth muscle stimulating gastric emptying and it may be superior to the phenothiazines for emesis associated with gastro-intestinal and biliary disease. It is licensed for use in children only as a second-line option for the prevention of delayed chemotherapy-induced nausea and vomiting, and the treatment of established postoperative nausea and vomiting. There is an increased risk of neurological side-effects in children.

Domperidone p. 291 acts at the chemoreceptor trigger zone. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects, such as sedation and dystonic reactions, because it does not readily cross the blood-brain barrier.

EvGr The $5HT_3$-receptor antagonists, granisetron p. 294 and ondansetron p. 295, are used in the management of nausea and vomiting in children receiving cytotoxics.

Dexamethasone has antiemetic effects and is used in the management of chemotherapy-induced nausea and vomiting.

The neurokinin 1-receptor antagonist, aprepitant p. 293, is used to prevent nausea and vomiting associated with chemotherapy. It is usually given in combination with a $5HT_3$-receptor antagonist (with or without a corticosteroid). A For further information on the prevention of nausea and vomiting caused by chemotherapy, see Cytotoxic drugs p. 605.

Nabilone p. 291 is a synthetic cannabinoid with antiemetic properties. There is limited evidence for nabilone use in children for nausea and vomiting caused by cytotoxic chemotherapy unresponsive to conventional antiemetics.

Nausea and vomiting during pregnancy

Nausea and vomiting in the first trimester of pregnancy is common and will usually resolve spontaneously within 16 to 20 weeks. EvGr For pregnant females who have nausea and vomiting, offer appropriate self-care advice (such as rest, oral hydration and dietary changes), and inform them about other available support (e.g. self-help information and support groups) and when to seek urgent medical advice. Take into consideration that a number of interventions may have already been tried. Antiemetics should be considered for females with persistent symptoms where self-care measures have been ineffective. If a non-pharmacological option is preferred, ginger may be helpful for mild to moderate nausea.

For females who choose pharmacological treatment, offer an antiemetic considering the advantages and disadvantages of each drug, as well as patient preference, and their experience with treatments in previous pregnancies. Although few drug options are specifically licensed for nausea and vomiting associated with pregnancy, their use is established practice. Antiemetic options include: cyclizine, prochlorperazine, promethazine hydrochloride p. 195, promethazine teoclate p. 297, and ondansetron. For further information on antiemetic options, see NICE guideline: **Antenatal care** (available at: www.nice.org.uk/guidance/ng201). Assess response to treatment after 24 hours; if the response is inadequate, switch to an antiemetic from a different therapeutic class. Reassess after 24 hours and if symptoms have not settled, specialist opinion should be sought. For females who have moderate to severe nausea and vomiting, consider intravenous fluids and adjunctive treatment with acupressure.

Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement, and sometimes nutritional support. For females with severe or persistent hyperemesis gravidarum, antiemetics given by the parenteral or rectal routes may be more suitable than the oral route. Supplementation with thiamine p. 716 must be considered in order to reduce the risk of Wernicke's encephalopathy. Ⓐ

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include post-pubertal female sex, over 3 years of age, a history or family history of postoperative nausea and vomiting or motion sickness, and postoperative use of long-acting opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. EvGr A combination of antiemetic drugs that have different mechanisms of action is often indicated in those at moderate and high risk of postoperative nausea and vomiting. When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with an antiemetic drug from a different therapeutic class.

Drugs used include $5HT_3$-receptor antagonists (e.g. ondansetron), dexamethasone, and droperidol p. 298. Ⓐ Cyclizine is licensed for the prevention and treatment of postoperative nausea and vomiting caused by opioids and general anaesthetics. Prochlorperazine is licensed for the prevention and treatment of nausea and vomiting.

Opioid-induced nausea and vomiting

Expert sources advise that cyclizine, ondansetron, and prochlorperazine are used to relieve opioid-induced nausea and vomiting; ondansetron has the advantage of not producing sedation.

Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. Hyoscine hydrobromide p. 297 is licensed to prevent motion sickness symptoms such as nausea, vomiting, and vertigo. For children aged 10 years and over, a transdermal hyoscine patch provides prolonged activity but it needs to be applied several hours before travelling. Antihistamine drugs may also be effective; the less sedating antihistamines include cinnarizine and cyclizine, and the more sedating antihistamines include promethazine hydrochloride p. 195 and promethazine teoclate p. 297. Domperidone, metoclopramide hydrochloride, $5HT_3$-receptor antagonists, and the phenothiazines (except promethazine—an antihistamine phenothiazine) are **ineffective** in motion sickness.

Nausea and vomiting associated with migraine

For information on the use of antiemetics in migraine attacks, see Migraine p. 322.

ANTIEMETICS AND ANTINAUSEANTS › ANTIHISTAMINES

Cyclizine

04-Sep-2020

● **INDICATIONS AND DOSE**

Nausea and vomiting of known cause | Nausea and vomiting associated with vestibular disorders

► BY MOUTH, OR BY INTRAVENOUS INJECTION
- Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
- Child 6–11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
- Child 12–17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

► BY RECTUM
- Child 2–5 years: 12.5 mg up to 3 times a day
- Child 6–11 years: 25 mg up to 3 times a day
- Child 12–17 years: 50 mg up to 3 times a day

► BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION
- Child 1–23 months: 3 mg/kg, dose to be given over 24 hours
- Child 2–5 years: 50 mg, dose to be given over 24 hours
- Child 6–11 years: 75 mg, dose to be given over 24 hours
- Child 12–17 years: 150 mg, dose to be given over 24 hours

Nausea and vomiting in palliative care

► BY SUBCUTANEOUS INFUSION
- Child 1–23 months: 3 mg/kg, dose to be given over 24 hours
- Child 2–5 years: 50 mg, dose to be given over 24 hours
- Child 6–11 years: 75 mg, dose to be given over 24 hours
- Child 12–17 years: 150 mg, dose to be given over 24 hours

► BY MOUTH
- Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg)
- Child 6–11 years: 25 mg up to 3 times a day
- Child 12–17 years: 50 mg up to 3 times a day

► BY INTRAVENOUS INJECTION
- Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes
- Child 6–11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes
- Child 12–17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes

► BY CONTINUOUS INTRAVENOUS INFUSION
- Child 1–23 months: 3 mg/kg, dose to be given over 24 hours
- Child 2–5 years: 50 mg, dose to be given over 24 hours
- Child 6–11 years: 75 mg, dose to be given over 24 hours
- Child 12–17 years: 150 mg, dose to be given over 24 hours

► BY RECTUM
- Child 2–5 years: 12.5 mg up to 3 times a day
- Child 6–11 years: 25 mg up to 3 times a day
- Child 12–17 years: 50 mg up to 3 times a day

● **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children.

- **CONTRA-INDICATIONS** Neonate (due to significant antimuscarinic activity)
- **CAUTIONS** Epilepsy · glaucoma · may counteract haemodynamic benefits of opioids · neuromuscular disorders—increased risk of transient paralysis with intravenous use · pyloroduodenal obstruction · severe heart failure—may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure · urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare or very rare** Agitation (more common at high doses) · angle closure glaucoma · depression
- **Frequency not known** Abdominal pain · agranulocytosis · angioedema · anxiety · apnoea · appetite decreased · arrhythmias · asthenia · bronchospasm · constipation · diarrhoea · disorientation · dizziness · drowsiness · dry mouth · dry throat · euphoric mood · haemolytic anaemia · hallucinations · headache · hepatic disorders · hypertension · hypotension · increased gastric reflux · insomnia · leucopenia · movement disorders · muscle complaints · nasal dryness · nausea · oculogyric crisis · palpitations · paraesthesia · photosensitivity reaction · seizure · skin reactions · speech disorder · thrombocytopenia · tinnitus · tremor · urinary retention · vision blurred · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Level of consciousness decreased
- With parenteral use Chills · consciousness impaired · injection site necrosis · pain · paralysis · sensation of pressure · thrombophlebitis

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** For administration *by mouth*, tablets may be crushed.

Mixing and compatibility for the use of syringe drivers in palliative care Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% *or* as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.

- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of cyclizine in palliative care, see www.medicinescomplete.com/#/content/palliative/antihistaminic-antimuscarinic-antiemetics.

- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- **Cyclizine (Non-proprietary)**

Cyclizine hydrochloride 50 mg Cyclizine 50mg tablets | 30 tablet [P] £2.35–£5.00 | 100 tablet [P] £9.27 DT = £4.58

Solution for injection

- **Cyclizine (Non-proprietary)**

Cyclizine lactate 50 mg per 1 ml Cyclizine 50mg/1ml solution for injection ampoules | 5 ampoule [PoM] £16.25 DT = £4.42 | 10 ampoule [PoM] £20.27–£35.00

ANTIEMETICS AND ANTINAUSEANTS › CANNABINOIDS

Nabilone

21-Jan-2020

- **INDICATIONS AND DOSE**

Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)

- BY MOUTH
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Adverse effects on mental state can persist for 48–72 hours after stopping · heart disease · history of psychiatric disorder · hypertension
- **INTERACTIONS** → Appendix 1: nabilone
- **SIDE-EFFECTS** Abdominal pain · appetite decreased · concentration impaired · confusion · depression · dizziness · drowsiness · drug use disorders · dry mouth · euphoric mood · feeling of relaxation · hallucination · headache · hypotension · movement disorders · nausea · psychosis · sleep disorder · tachycardia · tremor · vertigo · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Drowsiness and dizziness occur frequently with standard doses.

- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (primarily biliary excretion).
- **PATIENT AND CARER ADVICE**

Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

Effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see *Drugs and skilled tasks* under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

CAUTIONARY AND ADVISORY LABELS 2

- **Nabilone (Non-proprietary)**

Nabilone 250 microgram Nabilone 250microgram capsules | 20 capsule [PoM] £150.00 DT = £150.00 [CD2]

Nabilone 1 mg Nabilone 1mg capsules | 20 capsule [PoM] £196.00 DT = £196.00 [CD2]

ANTIEMETICS AND ANTINAUSEANTS › DOPAMINE RECEPTOR ANTAGONISTS

Domperidone

11-Nov-2021

- **INDICATIONS AND DOSE**

Relief of nausea and vomiting

- BY MOUTH
- Child 12–17 years (body-weight 35 kg and above): 10 mg up to 3 times a day for a usual maximum of 1 week; maximum 30 mg per day

continued →

Gastro-oesophageal reflux disease (but efficacy not proven) (specialist use only)

▸ BY MOUTH

▸ Neonate: 250 micrograms/kg 3 times a day, dose can be increased if response inadequate, increased if necessary up to 400 micrograms/kg 3 times a day, interrupt treatment occasionally to assess recurrence—consider restarting if symptoms recur, discontinue if response inadequate at higher dose.

▸ Child: 250 micrograms/kg 3 times a day (max. per dose 10 mg), dose can be increased if response inadequate, increased if necessary up to 400 micrograms/kg 3 times a day (max. per dose 20 mg), interrupt treatment occasionally to assess recurrence—consider restarting if symptoms recur, discontinue if response inadequate at higher dose

● **UNLICENSED USE** Not licensed for use in children for gastro-oesophageal reflux disease.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED DECEMBER 2019): DOMPERIDONE FOR NAUSEA AND VOMITING: LACK OF EFFICACY IN CHILDREN; REMINDER OF CONTRA-INDICATIONS IN ADULTS AND ADOLESCENTS

Domperidone is no longer indicated for the relief of nausea and vomiting in children aged under 12 years or those weighing less than 35 kg. A European review concluded that domperidone is not as effective in this population as previously thought and alternative treatments should be considered. Healthcare professionals are advised to adhere to the licensed dose and to use the lowest effective dose for the shortest possible duration (max. treatment duration should not usually exceed 1 week).

Healthcare professionals are also reminded of the existing contra-indications for use of domperidone (see *Contra-indications*, *Hepatic impairment*, and *Interactions*).

● **CONTRA-INDICATIONS** Cardiac disease · conditions where cardiac conduction is, or could be, impaired · gastro-intestinal haemorrhage · gastro-intestinal mechanical obstruction · gastro-intestinal mechanical perforation · if increased gastro-intestinal motility harmful · prolactinoma

● **INTERACTIONS** → Appendix 1: domperidone

● **SIDE-EFFECTS**

▸ **Common or very common** Dry mouth

▸ **Uncommon** Anxiety · asthenia · breast abnormalities · diarrhoea · drowsiness · headache · lactation disorders · libido loss

▸ **Frequency not known** Arrhythmias · depression · gynaecomastia · menstrual cycle irregularities · movement disorders · oculogyric crisis · QT interval prolongation · seizure · sudden cardiac death · urinary retention

● **PREGNANCY** Use only if potential benefit outweighs risk.

● **BREAST FEEDING** Amount too small to be harmful.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

● **RENAL IMPAIRMENT**

Dose adjustments EvGr For repeated doses, consider dose reduction and reduce frequency of administration (consult product literature). Ⓜ

● **PATIENT AND CARER ADVICE**

Arrhythmia Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

Medicines for Children leaflet: Domperidone for gastro-oesophageal reflux www.medicinesforchildren.org.uk/medicines/domperidone-for-gastro-oesophageal-reflux/

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

CAUTIONARY AND ADVISORY LABELS 22

▸ **Domperidone (Non-proprietary)**

Domperidone 1 mg per 1 ml Domperidone 1mg/ml oral suspension sugar free sugar-free | 200 ml PoM £24.85 DT = £24.85

Tablet

CAUTIONARY AND ADVISORY LABELS 22

▸ **Domperidone (Non-proprietary)**

Domperidone (as Domperidone maleate) 10 mg Domperidone 10mg tablets | 30 tablet PoM £2.17 DT = £0.73 | 100 tablet PoM £7.23 DT = £2.43

▸ **Motilium** (Zentiva Pharma UK Ltd)

Domperidone (as Domperidone maleate) 10 mg Motilium 10mg tablets | 30 tablet PoM £2.71 DT = £0.73 | 100 tablet PoM £9.04 DT = £2.43

Metoclopramide hydrochloride

28-Jun-2021

● **INDICATIONS AND DOSE**

Second-line option for treatment of established postoperative nausea and vomiting | Prevention of delayed chemotherapy-induced nausea and vomiting

▸ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

▸ Child: 100–150 micrograms/kg up to 3 times a day (max. per dose 10 mg), when administered by slow intravenous injection, to be given over at least 3 minutes

● **UNLICENSED USE** *Maxolon*® tablets not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose and duration of use have been made:

- In children aged 1–18 years, metoclopramide should only be used as a second-line option for prevention of delayed chemotherapy-induced nausea and vomiting and for treatment of established postoperative nausea and vomiting;
- Use of metoclopramide is contra-indicated in children aged under 1 year;
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Recommended dose is 100–150 micrograms/kg (max. 10 mg), repeated up to 3 times daily;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

● **CONTRA-INDICATIONS** 3–4 days after gastrointestinal surgery · epilepsy · gastro-intestinal haemorrhage · gastro-intestinal obstruction · gastro-intestinal perforation · phaeochromocytoma

- **CAUTIONS** Asthma · atopic allergy · bradycardia · cardiac conduction disturbances · children · may mask underlying disorders such as cerebral irritation · uncorrected electrolyte imbalance · young adults
- **INTERACTIONS** → Appendix 1: metoclopramide
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Asthenia · depression · diarrhoea · drowsiness · hypotension · menstrual cycle irregularities · movement disorders · parkinsonism
- **Uncommon** Arrhythmias · hallucination · hyperprolactinaemia · level of consciousness decreased
- **Rare or very rare** Confusion · galactorrhoea · seizure
- **Frequency not known** Atrioventricular block · blood disorders · cardiac arrest · gynaecomastia · hypertension · neuroleptic malignant syndrome · QT interval prolongation · shock · syncope · tremor

SPECIFIC SIDE-EFFECTS

- With parenteral use Anxiety · dizziness · dyspnoea · oedema · skin reactions · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young, especially girls and young women; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Use of an antimuscarinic drug such as procyclidine will abort dystonic attacks.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Small amount present in milk; avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of accumulation).
  Dose adjustments Manufacturer advises dose reduction of 50% in severe impairment.
- **RENAL IMPAIRMENT**
  Dose adjustments EvGr Reduce daily dose by 75% in end-stage renal disease.
  Reduce dose by 50% in moderate to severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises oral liquid preparation to be given via a graduated oral dosing syringe.
- **PATIENT AND CARER ADVICE** Counselling on use of pipette advised with oral solution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

- **Metoclopramide hydrochloride (Non-proprietary)**
  Metoclopramide hydrochloride 5 mg per 1 ml Metoclopramide 10mg/2ml solution for injection ampoules | 5 ampoule PoM £1.31-£2.79 | 10 ampoule PoM £0.49 DT = £3.19 (Hospital only) | 10 ampoule PoM £4.84 DT = £3.19

Oral solution

- **Metoclopramide hydrochloride (Non-proprietary)**
  Metoclopramide hydrochloride 1 mg per 1 ml Metoclopramide 5mg/5ml oral solution sugar free sugar-free | 150 ml PoM £19.79 DT = £19.79

Tablet

- **Metoclopramide hydrochloride (Non-proprietary)**
  Metoclopramide hydrochloride 5 mg Metoclopramide 5mg tablets | 28 tablet PoM £3.75
  Metoclopramide hydrochloride 10 mg Metoclopramide 10mg tablets | 28 tablet PoM £1.40 DT = £1.11
- **Maxolon** (Advanz Pharma)
  Metoclopramide hydrochloride 10 mg Maxolon 10mg tablets | 84 tablet PoM £5.24

ANTIEMETICS AND ANTINAUSEANTS › NEUROKININ RECEPTOR ANTAGONISTS

Aprepitant

11-Sep-2018

- **INDICATIONS AND DOSE**

Adjunct treatment to prevent nausea and vomiting associated with moderately and highly emetogenic chemotherapy

- BY MOUTH
- Child 6 months–11 years (body-weight 6 kg and above): (consult product literature)
- Child 12–17 years: Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, dose to be taken 1 hour before chemotherapy *or* in the morning if no chemotherapy is given, consult product literature for dose of concomitant $5HT_3$-antagonist (and corticosteroid if required)

- **CONTRA-INDICATIONS** Acute porphyrias p. 688
- **INTERACTIONS** → Appendix 1: neurokinin-1 receptor antagonists
- **SIDE-EFFECTS**
- **Common or very common** Appetite decreased · asthenia · constipation · gastrointestinal discomfort · headache · hiccups
- **Uncommon** Anaemia · anxiety · burping · dizziness · drowsiness · dry mouth · febrile neutropenia · gastrointestinal disorders · hot flush · malaise · nausea · palpitations · skin reactions · urinary disorders · vomiting
- **Rare or very rare** Bradycardia · cardiovascular disorder · chest discomfort · cognitive disorder · conjunctivitis · cough · disorientation · euphoric mood · gait abnormal · hyperhidrosis · increased risk of infection · muscle spasms · muscle weakness · oedema · oropharyngeal pain · photosensitivity reaction · polydipsia · seborrhoea · severe cutaneous adverse reactions (SCARs) · sneezing · stomatitis · taste altered · throat irritation · tinnitus · weight decreased
- **Frequency not known** Dysarthria · dyspnoea · insomnia · miosis · sensation abnormal · visual acuity decreased · wheezing
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effectiveness of hormonal contraceptives may be reduced—alternative non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.
- **PREGNANCY** Manufacturer advises avoid unless clearly necessary—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—limited information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Aprepitant (*Emend*®) as part of combination therapy, for the prevention of nausea and vomiting associated with moderately emetogenic cancer chemotherapy in infants, toddlers and children from the age of six months to less than 12 years (powder for oral suspension) and adolescents from the age of 12 years to 17 years (hard capsules) (June 2017)** SMC No. 1241/17 Recommended
- **Aprepitant (*Emend*®) as part of combination therapy, for the prevention of nausea and vomiting associated with highly emetogenic cancer chemotherapy in children, toddlers and infants from the age of six months to under 12 years (powder for oral suspension) and adolescents from the age of 12 years**

to 17 years (hard capsules) (July 2017) SMC No. 1252/17 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Powder

- **Emend** (Merck Sharp & Dohme (UK) Ltd)

Fosaprepitant

02-Nov-2020

- **DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

- **INDICATIONS AND DOSE**

Adjunct to $5HT_3$-receptor antagonist (with or without dexamethasone) in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

- BY INTRAVENOUS INFUSION
- Child 6 months–11 years (body-weight 6 kg and above): Initially 3 mg/kg (max. per dose 115 mg) on day 1 of cycle, then 2 mg/kg (max. per dose 80 mg) on days 2 and 3 of cycle, dose to be administered over 60 minutes and completed 30 minutes before chemotherapy, consult product literature for dose of concomitant corticosteroid and $5HT_3$-receptor antagonist and for information on alternative dosing for single and multi-day regimens
- Child 12–17 years: Initially 115 mg on day 1 of cycle, then 80 mg on days 2 and 3 of cycle, dose to be administered over 30 minutes and completed 30 minutes before chemotherapy, consult product literature for dose of concomitant corticosteroid and $5HT_3$-receptor antagonist and for information on alternative dosing for single and multi-day regimens

- **CONTRA-INDICATIONS** Acute porphyrias p. 688
- **INTERACTIONS** → Appendix 1: neurokinin-1 receptor antagonists
- **SIDE-EFFECTS**

- **Common or very common** Appetite decreased · asthenia · constipation · flushing · gastrointestinal discomfort · headache · hiccups
- **Uncommon** Anaemia · anxiety · burping · dizziness · drowsiness · dry mouth · febrile neutropenia · gastrointestinal disorders · malaise · nausea · palpitations · skin reactions · thrombophlebitis · urinary disorders · vomiting
- **Rare or very rare** Bradycardia · cardiovascular disorder · chest discomfort · cognitive disorder · conjunctivitis · cough · disorientation · euphoric mood · gait abnormal · hyperhidrosis · increased risk of infection · muscle spasms · muscle weakness · oedema · oropharyngeal pain · photosensitivity reaction · polydipsia · seborrhoea · severe cutaneous adverse reactions (SCARs) · sneezing · stomatitis · taste altered · throat irritation · tinnitus · weight decreased
- **Frequency not known** Dysarthria · dyspnoea · insomnia · miosis · sensation abnormal · visual acuity decreased · wheezing

- **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—limited information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Ivemend*®), manufacturer advises give intermittently *in* Sodium chloride 0.9%; reconstitute each 150 mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; for volumes less than 150 ml, transfer the required volume to a bag or syringe prior to infusion; infuse through central venous catheter.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- **Fosaprepitant (*Ivemend*®) for the prevention of nausea and vomiting associated with highly and moderately emetogenic cancer chemotherapy in patients aged 6 months to 17 years (November 2018)** SMC No. SMC2108 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions

- **Fosaprepitant (*Ivemend*®) for the prevention of nausea and vomiting associated with highly and moderately emetogenic cancer chemotherapy in patients aged 6 months to less than 18 years of age (December 2018)** AWMSG No. 3789 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Ivemend** (Merck Sharp & Dohme (UK) Ltd)
  Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg Ivemend 150mg powder for solution for infusion vials | 1 vial PoM £47.42

ANTIEMETICS AND ANTINAUSEANTS › SEROTONIN (5HT3) RECEPTOR ANTAGONISTS

Granisetron

16-Jul-2020

- **DRUG ACTION** Granisetron is a specific $5HT_3$-receptor antagonist which blocks $5HT_3$ receptors in the gastrointestinal tract and in the CNS.

- **INDICATIONS AND DOSE**

Management of nausea and vomiting induced by cytotoxic chemotherapy

- BY MOUTH
- Child 12–17 years: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following chemotherapy
- BY INTRAVENOUS INFUSION
- Child 2–17 years: 10–40 micrograms/kg (max. per dose 3 mg), repeated if necessary, to be given before start of chemotherapy, for treatment, dose may be repeated within 24 hours if necessary, not less than 10 minutes after initial dose; maximum 2 doses per day

- **UNLICENSED USE** Tablets not licensed in children (age range not specified by manufacturer).
- **CAUTIONS** Subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS** → Appendix 1: 5-HT3-receptor antagonists
- **SIDE-EFFECTS**
  - **Common or very common** Constipation · diarrhoea · headache · insomnia
  - **Uncommon** Extrapyramidal symptoms · QT interval prolongation · serotonin syndrome
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *intravenous infusion*, manufacturer advises dilute up to 3 mL of granisetron injection in Glucose 5% or Sodium Chloride 0.9% to a total volume of 10–30 mL; give over 5 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Granisetron (Non-proprietary)**
  Granisetron (as Granisetron hydrochloride) 1 mg per 1 ml Granisetron 3mg/3ml concentrate for solution for injection ampoules | 10 ampoule PoM £60.00–£72.00 DT = £72.00
  Granisetron 1mg/1ml concentrate for solution for injection ampoules | 10 ampoule PoM £20.00–£24.20 DT = £24.20

Tablet

- **Granisetron (Non-proprietary)**
  Granisetron (as Granisetron hydrochloride) 1 mg Granisetron 1mg tablets | 10 tablet PoM £52.39 DT = £40.80
  Granisetron (as Granisetron hydrochloride) 2 mg Granisetron 2mg tablets | 5 tablet PoM ₹ DT = £52.39
- **Kytril** (Atnahs Pharma UK Ltd)
  Granisetron (as Granisetron hydrochloride) 1 mg Kytril 1mg tablets | 10 tablet PoM £52.39 DT = £40.80
  Granisetron (as Granisetron hydrochloride) 2 mg Kytril 2mg tablets | 5 tablet PoM £52.39 DT = £52.39

Ondansetron

11-Feb-2021

- **DRUG ACTION** Ondansetron is a specific $5HT_3$-receptor antagonist which blocks $5HT_3$ receptors in the gastrointestinal tract and in the CNS.

- **INDICATIONS AND DOSE**

Gastro-enteritis, management of vomiting

- BY MOUTH
  - Child 6 months-17 years: 100–150 micrograms/kg every 8–12 hours (max. per dose 8 mg) as required
- BY SLOW INTRAVENOUS INJECTION
  - Child 6 months-17 years: 100 micrograms/kg every 8–12 hours (max. per dose 8 mg) as required, dose to be given over at least 30 seconds
- BY INTRAVENOUS INFUSION
  - Child 6 months-17 years: 150 micrograms/kg every 8–12 hours (max. per dose 8 mg) as required, dose to be given over at least 15 minutes

Prevention of postoperative nausea and vomiting

- BY SLOW INTRAVENOUS INJECTION
  - Child: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, dose to be given over at least 30 seconds before, during, or after induction of anaesthesia

Treatment of postoperative nausea and vomiting

- BY SLOW INTRAVENOUS INJECTION
  - Child: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, dose to be given over at least 30 seconds

Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—initial dose

- BY INTRAVENOUS INFUSION
  - Child 6 months-17 years (body surface area up to 1.3 m^2): 5 mg/m^2 for 1 dose then give orally, alternatively 150 micrograms/kg (max. per dose 8 mg), dose to be administered immediately before chemotherapy, then 150 micrograms/kg every 4 hours (max. per dose 8 mg) for 2 further doses then give orally; maximum 32 mg per day
  - Child 6 months-17 years (body surface area 1.3 m^2 and above): 8 mg for 1 dose then give orally, alternatively 150 micrograms/kg (max. per dose 8 mg), dose to be administered immediately before chemotherapy, then 150 micrograms/kg every 4 hours (max. per dose 8 mg) for 2 further doses then give orally, intravenous infusion to be administered over at least 15 minutes; maximum 32 mg per day

Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—(follow-on dose based on body surface area)

- BY MOUTH
  - Child 6 months-17 years (body surface area up to 0.6 m^2): 2 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months-17 years (body surface area 0.6-1.2 m^2): 4 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months-17 years (body surface area 1.3 m^2 and above): 8 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day

Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—(follow-on dose based on body-weight)

- BY MOUTH
  - Child 6 months-17 years (body-weight up to 10.1 kg): 2 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months-17 years (body-weight 10.1–40 kg): 4 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months-17 years (body-weight 41 kg and above): 8 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day

- **UNLICENSED USE** EvGr Ondansetron is used for the management of vomiting in children and young people with gastro-enteritis, Ⓔ but is not licensed for this indication. Not licensed for radiotherapy-induced nausea and vomiting in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ONDANSETRON: SMALL INCREASED RISK OF ORAL CLEFTS FOLLOWING USE IN THE FIRST 12 WEEKS OF PREGNANCY (JANUARY 2020)

Epidemiological studies have identified a small increased risk of cleft lip and/or cleft palate in babies born to women who used oral ondansetron during the first trimester of pregnancy. Healthcare professionals are advised that if there is a clinical need for ondansetron in pregnancy, patients should be counselled on the potential benefits and risks, and the final decision made jointly.

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Adenotonsillar surgery · subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1: 5-HT3-receptor antagonists
- **SIDE-EFFECTS**
  - **Common or very common** Constipation · feeling hot · headache · sensation abnormal

- **Uncommon** Arrhythmias · chest pain · hiccups · hypotension · movement disorders · oculogyric crisis · seizure
- **Rare or very rare** Dizziness · QT interval prolongation · vision disorders

- **PREGNANCY** Manufacturer advises avoid in first trimester—small increased risk of congenital abnormalities such as orofacial clefts, see *Important safety information*.
- **BREAST FEEDING** Present in milk in *animal* studies—avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (decreased clearance). **Dose adjustments** Manufacturer advises a reduced maximum daily dose in moderate to severe impairment—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use EvGr For *intravenous infusion*, dilute required dose in 25–50 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 15 minutes. M
  - With oral use Orodispersible films and lyophylisates should be placed on the tongue, allowed to disperse and swallowed.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Ondansetron (Non-proprietary)**
  Ondansetron (as Ondansetron hydrochloride) 4 mg Ondansetron 4mg tablets | 10 tablet PoM £30.57 DT = £0.83 | 30 tablet PoM £2.46–£107.91
  Ondansetron (as Ondansetron hydrochloride) 8 mg Ondansetron 8mg tablets | 10 tablet PoM £71.94 DT = £1.33
- **Zofran** (Novartis Pharmaceuticals UK Ltd)
  Ondansetron (as Ondansetron hydrochloride) 4 mg Zofran 4mg tablets | 30 tablet PoM £107.91

Orodispersible tablet

- **Ondansetron (Non-proprietary)**
  Ondansetron 4 mg Ondansetron 4mg orodispersible tablets | 10 tablet PoM £43.48 DT = £43.48
  Ondansetron 8 mg Ondansetron 8mg orodispersible tablets | 10 tablet PoM £85.43 DT = £85.43

ANTIHISTAMINES › SEDATING

Cinnarizine

27-Apr-2021

- **INDICATIONS AND DOSE**

Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière's disease

- BY MOUTH
  - Child 5–11 years: 15 mg 3 times a day
  - Child 12–17 years: 30 mg 3 times a day

Motion sickness

- BY MOUTH
  - Child 5–11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
  - Child 12–17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 688 · neonate (due to significant antimuscarinic activity)
- **CAUTIONS** Epilepsy · glaucoma · pyloroduodenal obstruction · urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**
  - **Common or very common** Drowsiness · gastrointestinal discomfort · nausea · weight increased
  - **Uncommon** Fatigue · hyperhidrosis · vomiting
  - **Frequency not known** Dry mouth · gastrointestinal disorder · headache · jaundice cholestatic · movement disorders · muscle rigidity · parkinsonism · skin reactions · subacute cutaneous lupus erythematosus · tremor
- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic insufficiency—no information available.
- **RENAL IMPAIRMENT** EvGr Use with caution (no information available). M
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- **Cinnarizine (Non-proprietary)**
  Cinnarizine 15 mg Cinnarizine 15mg tablets | 84 tablet P £15.40 DT = £4.55

Promethazine teoclate

26-Apr-2021

● **INDICATIONS AND DOSE**

Nausea | Vomiting | Labyrinthine disorders

► BY MOUTH

- Child 5–9 years: 12.5–37.5 mg daily
- Child 10–17 years: 25–75 mg daily; maximum 100 mg per day

Motion sickness prevention

► BY MOUTH

- Child 5–9 years: 12.5 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
- Child 10–17 years: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel

Motion sickness treatment

► BY MOUTH

- Child 5–9 years: Initially 12.5 mg, dose to be taken at onset of motion sickness, then 12.5 mg for a further two doses, doses to be taken at bedtime, starting on the evening of onset
- Child 10–17 years: Initially 25 mg, dose to be taken at onset of motion sickness, then 25 mg for a further two doses, doses to be taken at bedtime, starting on the evening of onset

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN (APRIL 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

● **CONTRA-INDICATIONS** Neonate (due to significant antimuscarinic activity) · should not be given to children under 2 years, except on specialist advice (potential for fatal respiratory depression)

● **CAUTIONS** Asthma · bronchiectasis · bronchitis · epilepsy · pyloroduodenal obstruction · Reye's syndrome · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

● **INTERACTIONS** → Appendix 1: antihistamines, sedating

● **SIDE-EFFECTS** Anticholinergic syndrome · anxiety · appetite decreased · arrhythmia · blood disorder · bronchial secretion viscosity increased · confusion · dizziness · drowsiness · dry mouth · epigastric discomfort · fatigue · haemolytic anaemia · headache · hypotension · jaundice · movement disorders · muscle spasms · nightmare · palpitations · photosensitivity reaction · urinary retention · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION Paradoxical stimulation may occur, especially with high doses.

● **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

● **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● **RENAL IMPAIRMENT** EvGr Use with caution. M

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Hyoscine hydrobromide

(Scopolamine hydrobromide)

27-Apr-2021

● **INDICATIONS AND DOSE**

Motion sickness

► BY MOUTH

- Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
- Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day

► BY TRANSDERMAL APPLICATION

- Child 10–17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

Hypersalivation associated with clozapine therapy

► BY MOUTH

- Child 12–17 years: 300 micrograms up to 3 times a day; maximum 900 micrograms per day

Excessive respiratory secretions

► BY MOUTH, OR BY SUBLINGUAL ADMINISTRATION

- Child 2–11 years: 10 micrograms/kg 4 times a day (max. per dose 300 micrograms)
- Child 12–17 years: 300 micrograms 4 times a day

► BY TRANSDERMAL APPLICATION

- Child 1 month–2 years: 250 micrograms every 72 hours, dose equates to a quarter patch
- Child 3–9 years: 500 micrograms every 72 hours, dose equates to a half patch
- Child 10–17 years: 1 mg every 72 hours, dose equates to one patch

Excessive respiratory secretion in palliative care

► BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION

- Child: 10 micrograms/kg every 4–8 hours (max. per dose 600 micrograms)

► BY CONTINUOUS SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION

- Child: 40–60 micrograms/kg over 24 hours

Bowel colic pain in palliative care

► BY MOUTH USING SUBLINGUAL TABLETS

- Child: 10 micrograms/kg 3 times a day (max. per dose 300 micrograms), as *Kwells*®.

Premedication

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Child 1–11 years: 15 micrograms/kg (max. per dose 600 micrograms), to be administered 30–60 minutes before induction of anaesthesia
- Child 12–17 years: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

continued →

- BY INTRAVENOUS INJECTION
- Child 1–11 years: 15 micrograms/kg (max. per dose 600 micrograms), to be administered immediately before induction of anaesthesia
- Child 12–17 years: 200–600 micrograms, to be administered immediately before induction of anaesthesia

- **UNLICENSED USE** Not licensed for use in excessive respiratory secretions or hypersalivation associated with clozapine therapy.

IMPORTANT SAFETY INFORMATION
Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **CAUTIONS** Epilepsy

CAUTIONS, FURTHER INFORMATION
- Anticholinergic syndrome
- With systemic use In some children hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

- **INTERACTIONS** → Appendix 1: hyoscine
- **SIDE-EFFECTS**
- **Common or very common**
- With transdermal use Eye disorders · eyelid irritation
- **Rare or very rare**
- With transdermal use Concentration impaired · glaucoma · hallucinations · memory loss · restlessness
- **Frequency not known**
- With oral use Asthma · cardiovascular disorders · central nervous system stimulation · gastrointestinal disorder · hallucination · hypersensitivity · hyperthermia · hypohidrosis · mydriasis · oedema · respiratory tract reaction · restlessness · seizure
- With parenteral use Agitation · angle closure glaucoma · arrhythmias · delirium · dysphagia · dyspnoea · epilepsy exacerbated · hallucination · hypersensitivity · idiosyncratic drug reaction · loss of consciousness · mydriasis · neuroleptic malignant syndrome · psychotic disorder · thirst
- With transdermal use Balance impaired

- **PREGNANCY** Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** EvGr Use with caution. Ⓜ
- **DIRECTIONS FOR ADMINISTRATION**
- With transdermal use Expert sources advise *patch* applied to hairless area of skin behind ear; if less than whole patch required **either** cut with scissors along full thickness ensuring membrane is not peeled away **or** cover portion to prevent contact with skin.
- With oral use For administration by *mouth*, expert sources advise injection solution may be given orally.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include raspberry.

Palliative care For further information on the use of hyoscine hydrobromide in palliative care, see www.medicinescomplete.com/#/content/palliative/hyoscine-hydrobromide.

- **PATIENT AND CARER ADVICE**
- With transdermal use Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time.

Driving and skilled tasks ▸ With transdermal use Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Levomepromazine

(Methotrimeprazine)

21-Oct-2021

- **INDICATIONS AND DOSE**

Restlessness and confusion in palliative care

- BY CONTINUOUS SUBCUTANEOUS INFUSION
- Child 1-11 years: 0.35–3 mg/kg, to be administered over 24 hours
- Child 12-17 years: 12.5–200 mg, to be administered over 24 hours

Nausea and vomiting in palliative care

- BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION
- Child 1 month-11 years: 100–400 micrograms/kg, to be administered over 24 hours
- Child 12-17 years: 5–25 mg, to be administered over 24 hours

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Patients receiving large initial doses should remain supine
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS**
- **Common or very common** Asthenia · heat stroke
- **Rare or very rare** Cardiac arrest · hepatic disorders
- **Frequency not known** Allergic dermatitis · delirium · gastrointestinal disorders · glucose tolerance impaired · hyponatraemia · photosensitivity reaction · priapism · SIADH
- **HEPATIC IMPAIRMENT** Manufacturer advises consider avoiding.
- **DIRECTIONS FOR ADMINISTRATION**
- With subcutaneous use For administration by *subcutaneous infusion*, manufacturer advises dilute with a suitable volume of Sodium Chloride 0.9%.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of levomepromazine in palliative care, see www.medicinescomplete.com/#/content/palliative/levomepromazine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Levomepromazine (Non-proprietary)

Levomepromazine hydrochloride 25 mg per 1 ml Levomepromazine 25mg/1ml solution for injection ampoules | 10 ampoule PoM £20.13 DT = £20.13

- Nozinan (Sanofi)

Levomepromazine hydrochloride 25 mg per 1 ml Nozinan 25mg/1ml solution for injection ampoules | 10 ampoule PoM £20.13 DT = £20.13

273

Prochlorperazine

04-Aug-2020

- **INDICATIONS AND DOSE**

Prevention and treatment of nausea and vomiting

- BY MOUTH
- Child 1-11 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
- Child 12-17 years: 5–10 mg up to 3 times a day if required
- BY INTRAMUSCULAR INJECTION
- Child 2-4 years: 1.25–2.5 mg up to 3 times a day if required
- Child 5-11 years: 5–6.25 mg up to 3 times a day if required
- Child 12-17 years: 12.5 mg up to 3 times a day if required

Nausea and vomiting in previously diagnosed migraine

- BY BUCCAL ADMINISTRATION
- Child 12-17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

DOSE EQUIVALENCE AND CONVERSION

- Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate ≡ 1 mg prochlorperazine mesilate.

- **UNLICENSED USE** Injection not licensed for use in children. *Buccastem M*® tablets not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid oral route in child under 10 kg · CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Hypotension (more likely after intramuscular injection)
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare or very rare** Glucose tolerance impaired · hyponatraemia · SIADH
- **Frequency not known** Photosensitivity reaction

SPECIFIC SIDE-EFFECTS

- **Rare or very rare**
- With buccal use Blood disorder · hepatic disorders
- **Frequency not known**
- With buccal use Oral disorders · skin eruption
- With intramuscular use Atrioventricular block · cardiac arrest · eye disorders · jaundice · nasal congestion · respiratory depression · skin reactions
- With oral use Atrioventricular block · autonomic dysfunction · cardiac arrest · consciousness impaired · hyperthermia · jaundice · nasal congestion · oculogyric crisis · respiratory depression · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Acute dystonias are more common with potent first-generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **DIRECTIONS FOR ADMINISTRATION**
- With buccal use Manufacturer advises buccal tablets are placed high between upper lip and gum and left to dissolve.
- **PATIENT AND CARER ADVICE**
- With buccal use Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

5 Pain

Pain, chronic

04-May-2022

Overview

Pain is defined as an unpleasant sensory and emotional experience associated with, or resembling that associated with, actual or potential tissue damage. Physiologically, it can be described as **neuropathic**, **nociceptive** or **nociplastic**, and be classified as either **acute** or **chronic** in nature. Acute nociceptive pain generally responds to treatment with conventional analgesics, whereas chronic, neuropathic, and nociplastic pain respond poorly to conventional analgesics and can be difficult to treat.

Pain that has been present for more than 12 weeks or beyond the expected time of wound healing is defined as chronic, and has a wide-ranging impact on the child and their family. Chronic pain can result from disease- or treatment-related effects (such as with cancer or arthritis). It may also occur where pain persists after surgical interventions, or be of idiopathic origin. In the management of chronic pain, both disease and illness (complex combination of biological, psychological and social factors) should be taken into account. Comorbid symptoms and behaviours often accompany chronic pain (such as fatigue, sleep disturbance, diminished physical functioning, anxiety and mood disorders, and reduced school attendance). These can add to overall suffering and discomfort, reduce quality of life, and can even prevent or delay recovery. If left untreated in childhood, the harmful effects of pain can extend into adulthood.

Aims of treatment

Treatment aims to reduce pain or the functional effects of pain, improve quality of life, and reduce the risk of longer-term harms.

Management of chronic pain

EvGr The management of chronic pain in children is limited by a lack of evidence for recommendations in practice. Children whose symptoms have not responded to initial treatment strategies used for acute pain episodes, should therefore be managed in conjunction with specialists in paediatric chronic pain. While there are pharmacological and non-pharmacological management strategies available for chronic pain, recommendations are largely based on limited evidence and expert consensus. When chronic pain is suspected, effective non-opioid treatment strategies can usually be continued on a case-by-case basis while awaiting specialist input. Ⓔ

Non-drug treatment

EvGr Early biopsychosocial assessment and psychological intervention should be considered, especially where the risk of disability or distress is high. Psychological interventions (such as acceptance and commitment therapy (ACT), cognitive behavioural therapy (CBT), narrative therapy, mindfulness, meditation, relaxation, and distraction) should be part of a multidisciplinary approach to chronic pain management, with face-to-face interventions provided by suitably trained and supervised practitioners. Online or computerised delivery of psychological strategies such as self-distraction, relaxation, and CBT can be considered if face-to-face delivery is unsuitable or unavailable, however there is limited evidence on the efficacy of psychological therapy delivered virtually.

Education of the child and their family/carers should include an explanation and reassurance on pain causation, a brief summary of relevant pain mechanisms, and the role of psychosocial and physical factors in maintaining chronic pain.

Encouraging movement and exercise (including physiotherapy and occupational therapy where appropriate) should be incorporated in the management of many types of chronic pain in children, with consideration of early interventions to increase movement, physical activity, and restore function. Play therapy (such as playful activities and expressive arts) facilitated by a trained play therapist may be considered in hospital or outpatient settings.

Transcutaneous electrical nerve stimulation (TENS) is a low risk intervention that should be considered in some cases.

Pain interventions such as local anaesthetic blockade should only be considered on a case-by-case basis in specialist centres. Ⓔ

Drug treatment

EvGr The pharmacological management of chronic pain in children should be part of a wider multidisciplinary approach and utilise supported self-management strategies. Careful assessment is required prior to starting analgesia, along with regular reviews (minimum of once a year) and planned reassessment of side-effects and ongoing benefit (such as pain relief, improvement in function, and/or quality of life). All drugs started for managing chronic pain should be on a trial basis, guided by specialists, limited to the shortest possible duration, and continued only if benefits outweigh risks. The availability of suitable formulations or products may also guide treatment choice. Ⓔ

For comparative information of pain relief medication, see Analgesics p. 301.

Non-opioid analgesics

EvGr The non-opioid analgesics paracetamol p. 302 and NSAIDs may be appropriate on occasions. Topical non-opioid analgesic preparations may be useful for the management of chronic musculoskeletal pain. The use of anti-neuropathic drugs such as low dose tricyclic antidepressants or antiepileptics for treating chronic pain should only be initiated in consultation with a specialist. Ⓔ

Opioid analgesics

Due to their side-effect profile and risks of addiction, physical dependence and overdose, opioids and compound analgesics that contain opioids are mostly unsuitable and are therefore rarely used in children with chronic pain. EvGr Opioid treatment should only be initiated by a paediatric specialist and used under exceptional circumstances, such as presence of known life-limiting illness. For children currently on opioids when chronic pain is suspected,

treatment doses should not be escalated and specialist advice should be sought. Ⓔ

Resources providing information around good practice for healthcare professionals when managing specialist-initiated opioids (based on adult evidence) have been produced by the Faculty of Pain Medicine in partnership with PHE, and are available at: fpm.ac.uk/opioids-aware. Applicability in children should be considered by the prescriber prior to use.

Analgesics

06-Oct-2020

Pain relief

The non-opioid drugs, paracetamol p. 302 and ibuprofen p. 747 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin. The MHRA/CHM have issued important safety information on the use of opioids and risk of dependence and addiction. For further information, see *Important safety information* in individual drug monographs.

Pain in sickle-cell disease

The pain of mild sickle-cell crises is managed with paracetamol, an NSAID, codeine phosphate p. 308, or dihydrocodeine tartrate p. 310. Severe crises may require the use of morphine p. 315 or diamorphine hydrochloride p. 309; concomitant use of an NSAID may potentiate analgesia and allow lower doses of the opioid to be used. A mixture of nitrous oxide and oxygen (*Entonox*®, *Equanox*®) may also be used.

Dental and orofacial pain

Analgesics should be used judiciously in dental care as a **temporary** measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzydamine hydrochloride p. 800 or topical anaesthetics until the cause of the mucosal disorder has been dealt with. However, where a child is febrile, the antipyretic action of paracetamol or ibuprofen is often helpful.

The *choice* of an analgesic for dental purposes should be based on its suitability for the child. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs) e.g. ibuprofen. Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for *moderate to severe pain*. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen is usually continued for about 24 to 72 hours.

Dysmenorrhoea

Paracetamol or a NSAID will generally provide adequate relief of pain from dysmenorrhoea. Alternatively use of a combined hormonal contraceptive in adolescent girls may prevent the pain.

Non-opioid analgesics and compound analgesic preparations

Paracetamol has analgesic and antipyretic properties but no demonstrable anti-inflammatory activity; unlike opioid analgesics, it does not cause respiratory depression and is less irritant to the stomach than the NSAIDs. **Overdosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of children with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred. They are also suitable for the relief of pain in *dysmenorrhoea* and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins. Due to an association with Reye's syndrome, aspirin p. 99 should be avoided in children under 16 years except in Kawasaki disease or for its antiplatelet action. Several NSAIDs are also used for postoperative analgesia.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as paracetamol) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol with a *low dose* of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) may be used in older children but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **overdosage** yet may not provide significant additional relief of pain.

A *full dose* of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Opioid analgesics and dependence

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain.

Strong opioids

Morphine remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of *severe pain in palliative care*. It is given regularly every

4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 306 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in children dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine p. 315 and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine p. 306 are only partially reversed by naloxone hydrochloride p. 954. It is rarely used in children.

Diamorphine hydrochloride p. 309 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In *palliative care* the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated child. Diamorphine hydrochloride is sometimes given by the intranasal route to treat acute pain in children and is available as a nasal spray; intranasal administration of diamorphine injection has been used [unlicensed].

Alfentanil p. 929, fentanyl p. 311 and remifentanil p. 930 are used by injection for intra-operative analgesia. Fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 333 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine when excitation (or exacerbation of pain) occurs with morphine. Methadone hydrochloride may also be used to treat children with neonatal abstinence syndrome.

Papaveretum should not be used in children; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pethidine hydrochloride p. 319 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. Its use in children is not recommended. Pethidine hydrochloride is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tramadol hydrochloride p. 320 is used in older children and produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids

Codeine phosphate p. 308 can be used for the relief of short-term acute moderate pain in children older than 12 years where other painkillers such as paracetamol below or ibuprofen p. 747 have proved ineffective.

Dihydrocodeine tartrate p. 310 has an analgesic efficacy similar to that of codeine phosphate.

Postoperative analgesia

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in neonates and in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side- effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

Patient-controlled analgesia (PCA) and nurse-controlled analgesia (NCA) can be used to relieve postoperative pain—consult hospital protocols.

Pain management and opioid dependence

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

Other drugs used for Pain Diclofenac potassium, p. 743 • Mefenamic acid, p. 750

ANALGESICS › NON-OPIOID

Paracetamol

(Acetaminophen)

11-Nov-2021

● **INDICATIONS AND DOSE**

Pain | **Pyrexia with discomfort**

► BY MOUTH

- Neonate 28 weeks to 32 weeks corrected gestational age: 20 mg/kg for 1 dose, then 10–15 mg/kg every 8–12 hours as required, maximum daily dose to be given in divided doses; maximum 30 mg/kg per day.
- Neonate 32 weeks corrected gestational age and above: 20 mg/kg for 1 dose, then 10–15 mg/kg every 6–8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day.
- Child 1-2 months: 30–60 mg every 8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day
- Child 3-5 months: 60 mg every 4–6 hours; maximum 4 doses per day
- Child 6-23 months: 120 mg every 4–6 hours; maximum 4 doses per day
- Child 2-3 years: 180 mg every 4–6 hours; maximum 4 doses per day
- Child 4-5 years: 240 mg every 4–6 hours; maximum 4 doses per day
- Child 6-7 years: 240–250 mg every 4–6 hours; maximum 4 doses per day
- Child 8-9 years: 360–375 mg every 4–6 hours; maximum 4 doses per day
- Child 10-11 years: 480–500 mg every 4–6 hours; maximum 4 doses per day
- Child 12-15 years: 480–750 mg every 4–6 hours; maximum 4 doses per day
- Child 16-17 years: 0.5–1 g every 4–6 hours; maximum 4 doses per day

► BY RECTUM

- Neonate 28 weeks to 32 weeks corrected gestational age: 20 mg/kg for 1 dose, then 10–15 mg/kg every 12 hours as required, maximum daily dose to be given in divided doses; maximum 30 mg/kg per day.
- Neonate 32 weeks corrected gestational age and above: 30 mg/kg for 1 dose, then 15–20 mg/kg every 8 hours as

required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day.

- Child 1-2 months: 30–60 mg every 8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day
- Child 3-11 months: 60–125 mg every 4–6 hours as required; maximum 4 doses per day
- Child 1-4 years: 125–250 mg every 4–6 hours as required; maximum 4 doses per day
- Child 5-11 years: 250–500 mg every 4–6 hours as required; maximum 4 doses per day
- Child 12-17 years: 500 mg every 4–6 hours

▸ BY INTRAVENOUS INFUSION

- Neonate 32 weeks corrected gestational age and above: 7.5 mg/kg every 8 hours, dose to be administered over 15 minutes.

- Neonate: 10 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 30 mg/kg per day.

- Child (body-weight up to 10 kg): 10 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 30 mg/kg per day
- Child (body-weight 10-50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
- Child (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day

Pain in children with risk factors for hepatotoxicity | **Pyrexia with discomfort in children with risk factors for hepatotoxicity**

▸ BY INTRAVENOUS INFUSION

- Neonate 32 weeks corrected gestational age and above: 7.5 mg/kg every 8 hours, dose to be administered over 15 minutes.

- Neonate: 10 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 30 mg/kg per day.

- Child (body-weight up to 10 kg): 10 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 30 mg/kg per day
- Child (body-weight 10-50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
- Child (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

Post-operative pain

▸ BY MOUTH

- Child 1 month-5 years: 20–30 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day
- Child 6-11 years: 20–30 mg/kg (max. per dose 1 g) for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day; maximum 4 g per day
- Child 12-17 years: 1 g every 4–6 hours; maximum 4 doses per day

▸ BY RECTUM

- Child 1-2 months: 30 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day
- Child 3 months-5 years: 30–40 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day
- Child 6-11 years: 30–40 mg/kg (max. per dose 1 g) for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day; maximum 4 g per day
- Child 12-17 years: 1 g every 4–6 hours; maximum 4 doses per day

Prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine (Bexsero®) given as part of the routine immunisation schedule

▸ BY MOUTH

- Child 2 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours, use weight-based doses for preterm infants born at less than 32 weeks gestation and currently weighing less than 4 kg—see oral doses for pain and pyrexia with discomfort
- Child 4 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours, use weight-based doses for preterm infants born at less than 32 weeks gestation and currently weighing less than 4 kg—see oral doses for pain and pyrexia with discomfort

Post-immunisation pyrexia in infants

▸ BY MOUTH

- Child 2-3 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required
- Child 4 months: 60 mg for 1 dose, then 60 mg after 4–6 hours; maximum 4 doses per day

- **UNLICENSED USE** Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. Not licensed for use in children under 2 months by mouth; under 3 months by rectum. EvGr Not licensed for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine. Ⓔ Intravenous infusion not licensed in pre-term neonates. Intravenous infusion dose not licensed in children and neonates with body-weight under 10 kg.
- **CAUTIONS** Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · body-weight under 50 kg · chronic alcohol consumption · chronic dehydration · chronic malnutrition · long-term use (especially in those who are malnourished)

  CAUTIONS, FURTHER INFORMATION EvGr Some patients may be at increased risk of experiencing toxicity at therapeutic doses, particularly those with a body-weight under 50 kg and those with risk factors for hepatotoxicity. Clinical judgement should be used to adjust the dose of oral and intravenous paracetamol in these patients.

  Co-administration of enzyme-inducing antiepileptic medications may increase toxicity; doses should be reduced. Ⓔ
- **INTERACTIONS** → Appendix 1: paracetamol
- **SIDE-EFFECTS**

  GENERAL SIDE-EFFECTS

▸ **Rare or very rare** Thrombocytopenia

  SPECIFIC SIDE-EFFECTS

▸ **Common or very common**
- With rectal use Anorectal erythema

▸ **Rare or very rare**
- With intravenous use Hypersensitivity · hypotension · leucopenia · malaise · neutropenia
- With rectal use Angioedema · liver injury · severe cutaneous adverse reactions (SCARs) · skin reactions

▸ **Frequency not known**
- With intravenous use Flushing · skin reactions · tachycardia
- With oral use Agranulocytosis · bronchospasm · hepatic function abnormal · rash · severe cutaneous adverse reactions (SCARs)
- With rectal use Agranulocytosis · blood disorder

Overdose Liver damage and less frequently renal damage can occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 944.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of toxicity).
- **RENAL IMPAIRMENT** EvGr Caution in severe impairment (consult product literature). Ⓜ
  Dose adjustments ▸ With intravenous use EvGr Increase infusion dose interval to at least every 6 hours if creatinine clearance 30 mL/minute or less. Ⓜ See p. 15.
- **DIRECTIONS FOR ADMINISTRATION**
  ▸ With intravenous use For *intravenous infusion* (*Perfalgan*®), manufacturer advises give in Glucose 5% *or* Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.
- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/medicines/paracetamol/
- **PROFESSION SPECIFIC INFORMATION**
  Dental practitioners' formulary Paracetamol Tablets may be prescribed.
  Paracetamol Soluble Tablets 500 mg may be prescribed.
  Paracetamol Oral Suspension may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository, powder

Tablet

ANALGESICS › OPIOIDS

Opioids

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BENZODIAZEPINES AND OPIOIDS: REMINDER OF RISK OF POTENTIALLY FATAL RESPIRATORY DEPRESSION (MARCH 2020)

The MHRA reminds healthcare professionals that opioids co-prescribed with benzodiazepines and benzodiazepine-like drugs can produce additive CNS depressant effects, thereby increasing the risk of sedation, respiratory depression, coma, and death. Healthcare professionals are advised to only co-prescribe if there is no alternative and, if necessary, the lowest possible doses should be given for the shortest duration. Patients should be closely monitored for signs of respiratory depression at initiation of treatment and when there is any change in prescribing, such as dose adjustments or new interactions. If methadone is co-prescribed with a benzodiazepine or benzodiazepine-like drug, the respiratory depressant effect of methadone may be delayed; patients should be monitored for at least 2 weeks after initiation or changes in prescribing. Patients should be informed of the signs and symptoms of respiratory depression and sedation, and advised to seek urgent medical attention should these occur.

MHRA/CHM ADVICE: OPIOIDS: RISK OF DEPENDENCE AND ADDICTION (SEPTEMBER 2020)

New safety recommendations have been issued following a review of the risks of dependence and addiction associated with prolonged use (longer than 3 months) of opioids for non-malignant pain.

Healthcare professionals are advised to:

- discuss with patients that prolonged use of opioids, even at therapeutic doses, may lead to dependence and addiction;
- agree a treatment strategy and plan for end of treatment with the patient before starting opioids;
- counsel patients and their carers on the risks of tolerance and potentially fatal unintentional overdose, as well as signs and symptoms of overdose;
- provide regular monitoring and support to patients at increased risk, such as those with current or history of substance use disorder (including alcohol misuse) or mental health disorders;
- taper dosage slowly at the end of treatment to reduce the risk of withdrawal effects associated with abrupt discontinuation (tapering high doses may take weeks or months);
- consider hyperalgesia in patients on long-term opioid treatment who present with increased pain sensitivity;
- consult product literature for the latest advice and warnings for opioid use during pregnancy (see also *Pregnancy*).

The MHRA has also issued a safety leaflet for patients—see *Patient and carer advice*.

- **CONTRA-INDICATIONS** Acute respiratory depression · comatose patients · head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment) · raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment) · risk of paralytic ileus

- **CAUTIONS** Adrenocortical insufficiency (reduced dose is recommended) · asthma (avoid during an acute attack) · central sleep apnoea · convulsive disorders · current or history of mental health disorder · current or history of substance use disorder · diseases of the biliary tract · hypotension · hypothyroidism (reduced dose is recommended) · impaired respiratory function (avoid in chronic obstructive pulmonary disease) · inflammatory bowel disorders · myasthenia gravis · obstructive bowel disorders · shock · urethral stenosis

CAUTIONS, FURTHER INFORMATION

- Dependence and addiction Prolonged use of opioid analgesics may lead to drug dependence and addiction, even at therapeutic doses. There is an increased risk in individuals with current or history of substance use disorder or mental health disorders. See also *Important safety information*.
- Central sleep apnoea Opioids cause a dose-dependent increased risk of central sleep apnoea, EvGr consider total opioid dose reduction. M
- Palliative care EvGr In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics. M

- **SIDE-EFFECTS**
  - **Common or very common** Arrhythmias · confusion · constipation · dizziness · drowsiness · dry mouth · euphoric mood · flushing · hallucination · headache · hyperhidrosis · miosis · nausea (more common on initiation) · palpitations · respiratory depression (with high doses) · skin reactions · urinary retention · vertigo · vomiting (more common on initiation)
  - **Uncommon** Drug dependence · dysphoria · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION **Respiratory depression** Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone. Neonates (particularly if pre-term) may be more susceptible.

Dependence, addiction, and withdrawal Long term use of opioids in non-malignant pain (longer than 3 months) carries an increased risk of dependence and addiction, even at therapeutic doses. At the end of treatment the dosage should be tapered slowly to reduce the risk of withdrawal effects; tapering from a high dose may take weeks or months. See also *Important safety information*.

Overdose Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 944 and consider the specific antidote, naloxone hydrochloride.

- **PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

- **TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.

- **PRESCRIBING AND DISPENSING INFORMATION** The *Faculty of Pain Medicine* has produced resources for healthcare professionals around opioid prescribing: www.fpm.ac.uk/faculty-of-pain-medicine/opioids-aware

- **PATIENT AND CARER ADVICE**

MHRA safety leaflet: Opioid medicines and the risk of addiction www.gov.uk/guidance/opioid-medicines-and-the-risk-of-addiction

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see *Drugs and driving* under Guidance on prescribing p. 1.

305

Buprenorphine

20-Apr-2022

- **DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

- **INDICATIONS AND DOSE**

Moderate to severe pain

- BY SUBLINGUAL ADMINISTRATION
- Child (body-weight 16-25 kg): 100 micrograms every 6–8 hours
- Child (body-weight 25-37.5 kg): 100–200 micrograms every 6–8 hours
- Child (body-weight 37.5-50 kg): 200–300 micrograms every 6–8 hours
- Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- Child 6 months-11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
- Child 12-17 years: 300–600 micrograms every 6–8 hours

- **UNLICENSED USE**
- With oral use Sublingual tablets not licensed for use in children under 6 years.
- With intramuscular use or intravenous use Injection not licensed for use in children under 6 months.

- **CONTRA-INDICATIONS**

SIXMO ® Contra-indications for magnetic resonance imaging (MRI) · history of keloid or hypertrophic scar formation

- **CAUTIONS** Impaired consciousness

SIXMO ® History of connective tissue disease · history of recurrent meticillin-resistant *Staphylococcus aureus* infection

BUVIDAL ® Susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare or very rare** Angioedema · bronchospasm
- **Frequency not known** Hepatic disorders

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With parenteral use Hypersensitivity · hypotension · withdrawal syndrome neonatal
- With sublingual use Fatigue · postural hypotension · sleep disorders
- **Uncommon**
- With sublingual use Anxiety · apnoea · appetite decreased · atrioventricular block · coma · conjunctivitis · coordination abnormal · cyanosis · depersonalisation · depression · diarrhoea · dyspepsia · dyspnoea · hypertension · pallor · paraesthesia · psychosis · seizure · speech slurred · tinnitus · tremor · urinary disorder · vision disorders
- **Frequency not known**
- With parenteral use Psychotic disorder · vision blurred
- With sublingual use Cerebrospinal fluid pressure increased · circulation impaired · haemorrhagic diathesis · oral disorders · syncope

Overdose The effects of buprenorphine are only partially reversed by naloxone.

- **PREGNANCY**

SIXMO ® EvGr Avoid—inappropriate due to inflexible dosing of preparation. Ⓜ

- **BREAST FEEDING** Present in low levels in breast milk.

Monitoring Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment (limited information available).
- **RENAL IMPAIRMENT** Some manufacturers advise caution in severe impairment (risk of increased and prolonged effects; consult product literature).

Dose adjustments For *sublingual tablets*, some manufacturers advise dose reduction may be required in severe impairment (consult product literature).

- **PRE-TREATMENT SCREENING** Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.
- **MONITORING REQUIREMENTS** Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises *sublingual tablets* may be halved.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buprenorphine products.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Co-codamol

13-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 302.

- **INDICATIONS AND DOSE**

Short-term treatment of acute moderate pain (using co-codamol 8/500 preparations only)

- BY MOUTH
- Child 12–15 years: 8/500 mg every 6 hours as required for maximum 3 days; maximum 32/2000 mg per day
- Child 16–17 years: 8/500–16/1000 mg every 6 hours as required for maximum 3 days; maximum 64/4000 mg per day

Short-term treatment of acute moderate pain (using co-codamol 15/500 preparations only)

- BY MOUTH
- Child 12–15 years: 15/500 mg every 6 hours as required for maximum 3 days; maximum 60/2000 mg per day
- Child 16–17 years: 15/500–30/1000 mg every 6 hours as required for maximum 3 days; maximum 120/4000 mg per day

Short-term treatment of acute moderate pain (using co-codamol 30/500 preparations only)

- BY MOUTH
- Child 12–15 years: 30/500 mg every 6 hours as required for maximum 3 days; maximum 120/2000 mg per day
- Child 16–17 years: 30/500–60/1000 mg every 6 hours as required for maximum 3 days; maximum 240/4000 mg per day

KAPAKE ® 15/500

Short-term treatment of acute pain

- BY MOUTH
- Child 12–15 years: 1 tablet every 6 hours as required for maximum 3 days; maximum 4 tablets per day
- Child 16–17 years: 2 tablets every 6 hours as required for maximum 3 days; maximum 8 tablets per day

IMPORTANT SAFETY INFORMATION
See codeine phosphate p. 308 for MHRA/CHM advice for restrictions on the use of codeine as an analgesic in children.

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · children who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distention develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers
- **CAUTIONS** Acute abdomen · alcohol dependence · avoid abrupt withdrawal after long-term treatment · cardiac arrhythmias · chronic alcoholism · chronic dehydration · chronic malnutrition · not recommended for adolescents aged 12–18 years with breathing problems

CAUTIONS, FURTHER INFORMATION

- Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.
- **INTERACTIONS** → Appendix 1: opioids · paracetamol
- **SIDE-EFFECTS** Abdominal pain · addiction · agranulocytosis · blood disorder · irritability · pancreatitis · restlessness · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
  Overdose Liver damage (and less frequently renal damage) following overdosage with paracetamol.
- **BREAST FEEDING** Manufacturer advises avoid (recommendation also supported by MHRA and specialist sources). Present in milk and mothers vary considerably in their capacity to metabolise codeine; risk of opioid toxicity in infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  Dose adjustments Manufacturer advises consider dose reduction in mild to moderate impairment.
- **RENAL IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.
  When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.
  The Drug Tariff allows tablets of co-codamol labelled 'dispersible' to be dispensed against an order for 'effervescent' and *vice versa*.
- **LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice,* London, Pharmaceutical Press (always consult latest edition).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

305

Codeine phosphate

10-Nov-2021

INDICATIONS AND DOSE

Acute diarrhoea

BY MOUTH

- Child 12-17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

Short-term treatment of acute moderate pain

BY MOUTH, OR BY INTRAMUSCULAR INJECTION

- Child 12-17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY

Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:

- in children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
- codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
- codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
- codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
- parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, 'pin-point' pupils, nausea, vomiting)

MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:

- children younger than 12 years old
- patients of any age known to be CYP2D6 ultra-rapid metabolisers
- breastfeeding mothers

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers
- **CAUTIONS** Acute abdomen · cardiac arrhythmias · gallstones · not recommended for adolescents aged 12–18 years with breathing problems

CAUTIONS, FURTHER INFORMATION

- Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**

  GENERAL SIDE-EFFECTS Biliary spasm · hypothermia · mood altered · postural hypotension · sexual dysfunction · ureteral spasm

  SPECIFIC SIDE-EFFECTS

  ▸ With oral use Abdominal cramps · addiction · appetite decreased · depression · dyskinesia · dyspnoea · face oedema · fatigue · fever · hyperglycaemia · hypersensitivity · hypotension (with high doses) · intracranial pressure increased · lymphadenopathy · malaise · muscle rigidity (with high doses) · nightmare · pancreatitis · restlessness · seizure · splenomegaly · urinary disorders · vision disorders

  ▸ With parenteral use Dysuria
- **BREAST FEEDING** Manufacturer advises avoid (recommendation also supported by MHRA and specialist sources). Present in milk and mothers vary considerably in their capacity to metabolise codeine; risk of opioid toxicity in infant.
- **HEPATIC IMPAIRMENT**

  ▸ With oral use Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

  ▸ With intramuscular use Manufacturer advises avoid.

  Dose adjustments ▸ With oral use Manufacturer advises dose reduction in mild to moderate impairment.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.
- **PATIENT AND CARER ADVICE**

Diamorphine hydrochloride

(Heroin hydrochloride)

13-Nov-2020

- **INDICATIONS AND DOSE**

Acute or chronic pain

▸ BY MOUTH

▸ Child 1 month–11 years: 100–200 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response

▸ Child 12–17 years: 5–10 mg every 4 hours, adjusted according to response

▸ BY CONTINUOUS INTRAVENOUS INFUSION

▸ Child 1 month–11 years: 12.5–25 micrograms/kg/hour, adjusted according to response

▸ BY INTRAVENOUS INJECTION

▸ Child 1–2 months: 20 micrograms/kg every 6 hours, adjusted according to response

▸ Child 3–5 months: 25–50 micrograms/kg every 6 hours, adjusted according to response

▸ Child 6–11 months: 75 micrograms/kg every 4 hours, adjusted according to response

▸ Child 1–11 years: 75–100 micrograms/kg every 4 hours (max. per dose 5 mg), adjusted according to response

▸ Child 12–17 years: 2.5–5 mg every 4 hours, adjusted according to response

▸ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

▸ Child 12–17 years: 5 mg every 4 hours, adjusted according to response

Acute or chronic pain in ventilated neonates

▸ INITIALLY BY INTRAVENOUS INJECTION

▸ Neonate: Initially 50 micrograms/kg, dose to be administered over 30 minutes, followed by (by continuous intravenous infusion) 15 micrograms/kg/hour, adjusted according to response.

Acute or chronic pain in non-ventilated neonates

▸ BY CONTINUOUS INTRAVENOUS INFUSION

▸ Neonate: 2.5–7 micrograms/kg/hour, adjusted according to response.

Acute severe nociceptive pain in an emergency setting (specialist supervision in hospital)

▸ BY INTRANASAL ADMINISTRATION

▸ Child 2–15 years (body-weight 12–17 kg): 1.44 mg for 1 dose, spray into alternate nostrils

▸ Child 2–15 years (body-weight 18–23 kg): 2.16 mg for 1 dose, spray into alternate nostrils

▸ Child 2–15 years (body-weight 24–29 kg): 2.88 mg for 1 dose, spray into alternate nostrils

▸ Child 2–15 years (body-weight 30–39 kg): 3.2 mg for 1 dose, spray into alternate nostrils

▸ Child 2–15 years (body-weight 40–50 kg): 4.8 mg for 1 dose, spray into alternate nostrils

- **CONTRA-INDICATIONS** Delayed gastric emptying · phaeochromocytoma
- **CAUTIONS** CNS depression · severe cor pulmonale · severe diarrhoea · toxic psychosis
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**

▸ **Common or very common**

▸ With intranasal use Haemorrhage · laryngitis · nasal complaints · procedural pain · taste altered

▸ **Uncommon**

▸ With intranasal use Abdominal pain · anxiety · conjunctivitis · drug toxicity · eye pruritus · feeling hot · fever · hiccups · hypoxia · level of consciousness decreased · pallor · paraesthesia · visual impairment

- Frequency not known
- With parenteral use Biliary spasm · circulatory depression · intracranial pressure increased · mood altered · postural hypotension

- **BREAST FEEDING** Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
  Dose adjustments Manufacturer advises dose reduction.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.
- **MONITORING REQUIREMENTS**
  - With intranasal use Manufacturer advises monitor for at least 30 minutes following administration.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *intravenous infusion*, manufacturer advises dilute in Glucose 5% or Sodium Chloride 0.9%; Glucose 5% is preferable as an infusion fluid.
  - With intranasal use Manufacturer advises spray should be directed at the nasal side wall whilst the patient is in a semi-recumbent position.
- **PRESCRIBING AND DISPENSING INFORMATION** Intranasal administration of diamorphine hydrochloride injection has been used [unlicensed]—no dose recommendation.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  For full details see funding body website

  All Wales Medicines Strategy Group (AWMSG) decisions
  - **Diamorphine hydrochloride (*Ayendi*®) for the treatment of acute severe nociceptive pain in children and adolescents 2 to 15 years of age in a hospital setting. Diamorphine hydrochloride nasal spray should be administered in the emergency setting by practitioners experienced in the administration of opioids in children and with appropriate monitoring (November 2019)** AWMSG No. 2406 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, powder for solution for injection

  - Child 1–3 years: 500 micrograms/kg every 4–6 hours
  - Child 4–11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
  - Child 12–17 years: 30 mg every 4–6 hours (max. per dose 50 mg)

Chronic severe pain

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Child 12–17 years: 60–120 mg every 12 hours

DF118 FORTE ®

Severe pain

- BY MOUTH
  - Child 12–17 years: 40–80 mg 3 times a day; maximum 240 mg per day

- **UNLICENSED USE** Most preparations not licensed for use in children under 4 years.
- **CAUTIONS** Pancreatitis · severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**

  GENERAL SIDE-EFFECTS Dysuria · mood altered · postural hypotension

  SPECIFIC SIDE-EFFECTS
  - With oral use Biliary spasm · bronchospasm · hypothermia · sexual dysfunction · ureteral spasm
- **BREAST FEEDING** Specialist sources indicate caution—use the lowest effective dose for the shortest possible duration; monitor infant for adverse effects, including sedation, breathing difficulties, constipation, difficulty feeding and poor weight gain.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding.
  Dose adjustments Manufacturer advises dose reduction, if used.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PROFESSION SPECIFIC INFORMATION**

  Dental practitioners' formulary Dihydrocodeine tablets 30 mg may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

F 305

Dihydrocodeine with paracetamol

16-Feb-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 302.

- **INDICATIONS AND DOSE**

Mild to moderate pain (using 10/500 preparations only)

- BY MOUTH
- Child 12–17 years: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

Severe pain (using 20/500 preparations only)

- BY MOUTH
- Child 12–17 years: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

Severe pain (using 30/500 preparations only)

- BY MOUTH
- Child 12–17 years: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

DOSE EQUIVALENCE AND CONVERSION

- A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIHYDROCODEINE WITH PARACETAMOL (CO-DYDRAMOL): PRESCRIBE AND DISPENSE BY STRENGTH TO MINIMISE RISK OF MEDICATION ERROR (JANUARY 2018)

The MHRA has advised that dihydrocodeine with paracetamol preparations are prescribed and dispensed by strength to minimise dispensing errors and the risk of accidental opioid overdose—see Prescribing and dispensing information.

- **CAUTIONS** Alcohol dependence · before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · chronic alcoholism · chronic dehydration · chronic malnutrition · pancreatitis · severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids · paracetamol
- **SIDE-EFFECTS** Abdominal pain · blood disorder · leucopenia · malaise · neutropenia · pancreatitis · paraesthesia · paralytic ileus · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

  Overdose Liver damage (and less frequently renal damage) following overdosage with paracetamol.
- **BREAST FEEDING** Specialist sources indicate caution—use the lowest effective dose for the shortest possible duration; monitor infant for adverse effects, including sedation, breathing difficulties, constipation, difficulty feeding and poor weight gain.
- **HEPATIC IMPAIRMENT** Manufacturer advises consider avoiding in mild to moderate impairment; avoid in severe impairment.

  Dose adjustments Manufacturer advises dose reduction in mild to moderate impairment, if used.
- **RENAL IMPAIRMENT** Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.
- **PRESCRIBING AND DISPENSING INFORMATION** The MHRA advises when prescribing dihydrocodeine with paracetamol, the tablet strength and dose must be clearly indicated; when dispensing dihydrocodeine with paracetamol, ensure the prescribed strength is supplied—contact the prescriber if in doubt.

  The BP defines *Co-dydramol* Tablets as containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg.
- **LESS SUITABLE FOR PRESCRIBING** Dihydrocodeine with paracetamol is less suitable for prescribing.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 29, 30

- **Dihydrocodeine with paracetamol (Non-proprietary)**

  Dihydrocodeine tartrate 30 mg, Paracetamol 500 mg Remedeine Forte tablets | 56 tablet PoM £6.82 DT = £6.82 CD5

F 305

Fentanyl

26-Oct-2021

- **INDICATIONS AND DOSE**

Chronic intractable pain not currently treated with a strong opioid analgesic (not opioid-naive patients)

- BY TRANSDERMAL APPLICATION
- Child 16–17 years: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 72 hour intervals in steps of 12–25 micrograms/hour if necessary. After a dose increase, the system should be worn through two 72-hour applications before any further increase in dose, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 20 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

Chronic intractable pain currently treated with a strong opioid analgesic

- BY TRANSDERMAL APPLICATION
- Child 2–17 years: Initial dose based on previous 24-hour opioid requirement—consult product literature, for evaluating analgesic efficacy and dose increments—consult product literature, for conversion

continued →

from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* under Prescribing in palliative care p. 19.

Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation

► BY INTRAVENOUS INJECTION

- Child 1 month–11 years: Initially 1–3 micrograms/kg, then 1 microgram/kg as required, dose to be administered over at least 30 seconds
- Child 12–17 years: Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required, dose to be administered over at least 30 seconds

Assisted ventilation: analgesia and enhancement of anaesthesia during operation

► BY INTRAVENOUS INJECTION

- Neonate: Initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required, dose to be administered over at least 30 seconds.
- Child 1 month–11 years: Initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required, dose to be administered over at least 30 seconds
- Child 12–17 years: Initially 1–5 micrograms/kg, then 50–200 micrograms as required, dose to be administered over at least 30 seconds

Assisted ventilation: analgesia and respiratory depression in intensive care

► INITIALLY BY INTRAVENOUS INJECTION

- Neonate: Initially 1–5 micrograms/kg, then (by intravenous infusion) 1.5 micrograms/kg/hour, adjusted according to response.
- Child: Initially 1–5 micrograms/kg, then (by intravenous infusion) 1–6 micrograms/kg/hour, adjusted according to response

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

► BY BUCCAL ADMINISTRATION USING LOZENGES

- Child 16–17 years: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

DOSE EQUIVALENCE AND CONVERSION

- Fentanyl films are **not bioequivalent** to other fentanyl preparations.
- Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

● **UNLICENSED USE**

- With intravenous use Not licensed for use in children under 2 years; infusion not licensed for use in children under 12 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: TRANSDERMAL FENTANYL PATCHES: LIFE-THREATENING AND FATAL OPIOID TOXICITY FROM ACCIDENTAL EXPOSURE, PARTICULARLY IN CHILDREN (OCTOBER 2018)

Accidental exposure to transdermal fentanyl can occur if a patch is swallowed or transferred to another individual. Always fully inform patients and their carers about directions for safe use of fentanyl patches, including the importance of:

- not exceeding the prescribed dose;
- following the correct frequency of patch application, avoiding touching the adhesive side of patches, and washing hands after application;
- not cutting patches and avoiding exposure of patches to heat including via hot water;
- ensuring that old patches are removed before applying a new one;
- following instructions for safe storage and properly disposing of used patches or those which are not needed.

Patients and carers should be advised to seek immediate medical attention if overdose is suspected—see *Side-effects* and *Patient and carer advice* for further information.

MHRA/CHM ADVICE: TRANSDERMAL FENTANYL PATCHES FOR NON-CANCER PAIN: DO NOT USE IN OPIOID-NAIVE PATIENTS (SEPTEMBER 2020)

A review noted that serious harm, including fatalities, has been reported with the use of fentanyl patches in both opioid-naive and opioid-tolerant patients. There is considerable risk of respiratory depression with the use of fentanyl, especially in opioid-naive patients, and significant risk with too rapid an escalation of dose, even in long-term opioid-tolerant patients.

The MHRA advises healthcare professionals that the use of fentanyl transdermal patches is contra-indicated in opioid-naive patients; other analgesics and other opioids for non-malignant pain should be used before prescribing fentanyl patches. Patients and their carers should be reminded about the directions for safe use of fentanyl patches (see above).

● **CONTRA-INDICATIONS**

- With transdermal use Opioid-naive patients

● **CAUTIONS**

GENERAL CAUTIONS Bradyarrhythmias · cerebral tumour · diabetes mellitus (with *Actiq*® and *Cynril*® lozenges) · impaired consciousness

SPECIFIC CAUTIONS

- With buccal use Mucositis—absorption from oral preparations may be increased, caution during dose titration

CAUTIONS, FURTHER INFORMATION

- With transdermal use EvGr Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Ⓜ
- With intravenous use EvGr Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Ⓜ

● **INTERACTIONS** → Appendix 1: opioids

● **SIDE-EFFECTS**

- **Common or very common**
- With parenteral use Apnoea · hypertension · hypotension · movement disorders · muscle rigidity · post procedural complications · respiratory disorders · vascular pain · visual impairment
- With transdermal use Anxiety · appetite decreased · asthenia · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · hypertension · insomnia · malaise · muscle complaints · peripheral oedema · sensation abnormal · temperature sensation altered · tremor

- **Uncommon**
- With parenteral use Airway complication of anaesthesia · chills · hiccups · hypothermia
- With transdermal use Consciousness impaired · cyanosis · fever · gastrointestinal disorders · hypotension · influenza like illness · memory loss · respiratory disorders · seizures · sexual dysfunction · vision blurred
- **Rare or very rare**
- With transdermal use Apnoea
- **Frequency not known**
- With buccal use Adrenal insufficiency · androgen deficiency · anxiety · appetite decreased · asthenia · coma · depersonalisation · depression · diarrhoea · dyspnoea · emotional lability · fever · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · gingival haemorrhage · gingivitis · injury · loss of consciousness · malaise · myoclonus · oral disorders · peripheral oedema · seizure · sensation abnormal · sleep disorders · speech slurred · taste altered · thinking abnormal · throat oedema · vasodilation · vision disorders · weight decreased · withdrawal syndrome neonatal
- With parenteral use Biliary spasm · cardiac arrest · cough · hyperalgesia · loss of consciousness · seizure
- With transdermal use Myoclonus · withdrawal syndrome neonatal

SIDE-EFFECTS, FURTHER INFORMATION **Muscle rigidity** Intravenous administration of fentanyl can cause muscle rigidity, which may involve the thoracic muscles. Manufacturer advises administration by slow intravenous injection to avoid; higher doses may require premedication with benzodiazepines and muscle relaxants.

Transdermal use Monitor patients using patches for increased side-effects if fever is present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

- **BREAST FEEDING**
- With buccal use Manufacturer advises avoid during treatment and for 5 days after last administration—present in milk.
- With intravenous use Manufacturer advises avoid during treatment and for 24 hours after last administration—present in milk.
- With transdermal use Manufacturer advises avoid during treatment and for 72 hours after removal of patch—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of accumulation).
  Dose adjustments Manufacturer advises cautious dose titration.

- **RENAL IMPAIRMENT** Manufacturer advises caution (risk of increased and prolonged effects).
  Dose adjustments ▸ With intravenous use Manufacturer advises consider dose reduction.

- **DIRECTIONS FOR ADMINISTRATION**
- With transdermal use EvGr For *patches*, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days). Ⓜ
- With intravenous use EvGr For *intravenous infusion*, injection solution may be diluted in Glucose 5% or Sodium Chloride 0.9%. Ⓜ
- With buccal use EvGr Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose. Ⓜ

- **PRESCRIBING AND DISPENSING INFORMATION**
- With transdermal use Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write *'Fentanyl* 25 *patches'* to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. *'one patch to be applied every* 72 *hours'*. The total quantity of patches to be supplied should be written in words and figures.

- **PATIENT AND CARER ADVICE**
- With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdosage. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.

  Patients or carers should be given advice on how to administer fentanyl lozenges.

305

Hydromorphone hydrochloride

11-May-2021

- **INDICATIONS AND DOSE**

Severe pain in cancer

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

- **CONTRA-INDICATIONS** Acute abdomen
- **CAUTIONS** Pancreatitis · toxic psychosis
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · anxiety · appetite decreased · asthenia · sleep disorders
  - **Uncommon** Depression · diarrhoea · dyspnoea · erectile dysfunction · hypotension · malaise · movement disorders · paraesthesia · peripheral oedema · taste altered · tremor · visual impairment
  - **Frequency not known** Hyperalgesia · paralytic ileus · seizure · withdrawal syndrome neonatal
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** EvGr Use with caution. Ⓜ
  Dose adjustments EvGr Consider dose reduction (risk of increased and prolonged effects). Ⓜ
- **DIRECTIONS FOR ADMINISTRATION** For *immediate-release* capsules, manufacturer advises swallow whole capsule or sprinkle contents on soft food. For *modified-release* capsules, manufacturer advises swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 2

- **Palladone SR** (Napp Pharmaceuticals Ltd)
  Hydromorphone hydrochloride 2 mg Palladone SR 2mg capsules | 56 capsule PoM £20.98 DT = £20.98 CD2
  Hydromorphone hydrochloride 4 mg Palladone SR 4mg capsules | 56 capsule PoM £28.75 DT = £28.75 CD2
  Hydromorphone hydrochloride 8 mg Palladone SR 8mg capsules | 56 capsule PoM £56.08 DT = £56.08 CD2
  Hydromorphone hydrochloride 16 mg Palladone SR 16mg capsules | 56 capsule PoM £106.53 DT = £106.53 CD2

● **INDICATIONS AND DOSE**

Pain

► BY SUBCUTANEOUS INJECTION

- Neonate: Initially 100 micrograms/kg every 6 hours, adjusted according to response.
- Child 1–5 months: Initially 100–200 micrograms/kg every 6 hours, adjusted according to response
- Child 6 months–1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
- Child 2–11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response
- Child 12–17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response

► INITIALLY BY INTRAVENOUS INJECTION

- Neonate: 50 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 50 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 5–20 micrograms/kg/hour, adjusted according to response.
- Child 1–5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
- Child 6 months–11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- Child 12–17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response

► BY MOUTH, OR BY RECTUM

- Child 1–2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response
- Child 3–5 months: 100–150 micrograms/kg every 4 hours, adjusted according to response
- Child 6–11 months: 200 micrograms/kg every 4 hours, adjusted according to response
- Child 1 year: Initially 200–300 micrograms/kg every 4 hours, adjusted according to response
- Child 2–11 years: Initially 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response
- Child 12–17 years: Initially 5–10 mg every 4 hours, adjusted according to response

► BY CONTINUOUS SUBCUTANEOUS INFUSION

- Child 1–2 months: 10 micrograms/kg/hour, adjusted according to response
- Child 3 months–17 years: 20 micrograms/kg/hour, adjusted according to response

Pain (with modified-release 12-hourly preparations)

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Child: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain (with modified-release 24-hourly preparations)

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Child: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Neonatal opioid withdrawal (under expert supervision)

► BY MOUTH

- Neonate: Initially 40 micrograms/kg every 4 hours until symptoms controlled, dose to be increased if necessary; reduce frequency gradually over 6–10 days, stop when 40 micrograms/kg once daily achieved, dose may vary—consult local guidelines.

Persistent cyanosis in congenital heart disease when blood glucose less than 3 mmol/litre (following glucose)

► BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Child: 100 micrograms/kg

DOSE EQUIVALENCE AND CONVERSION

- The doses stated refer equally to morphine hydrochloride and sulfate.

● **UNLICENSED USE**

- With oral use *Oramorph*® solution and *MXL*® capsules not licensed for use in children under 1 year. *Sevredol*® tablets not licensed for use in children under 3 years. *Oramorph*® unit dose vials and *Filnarine*® SR tablets not licensed for use in children under 6 years. *MST Continus*® preparations licensed to treat children with cancer pain (age-range not specified by manufacturer).
- With rectal use Suppositories are not licensed for use in children.

IMPORTANT SAFETY INFORMATION
Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

● **CONTRA-INDICATIONS** Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · phaeochromocytoma

● **CAUTIONS** Cardiac arrhythmias · pancreatitis · severe cor pulmonale

● **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**
  - **Common or very common**
  - With oral use Appetite decreased · asthenic conditions · gastrointestinal discomfort · insomnia · neuromuscular dysfunction
  - **Uncommon**
  - With oral use Agitation · bronchospasm · hypotension · ileus · mood altered · myoclonus · peripheral oedema · pulmonary oedema · seizure · sensation abnormal · syncope · taste altered · visual impairment
  - **Frequency not known**
  - With oral use Amenorrhoea · biliary pain · cough decreased · hyperalgesia · hypertension · pancreatitis exacerbated · sexual dysfunction · thinking abnormal · ureteral spasm
  - With parenteral use Alertness decreased · bile duct disorders · mood altered · myoclonus · postural hypotension · sexual dysfunction · ureteral spasm · urinary disorders · vision disorders
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Avoid *oral preparations* in acute impairment; for *injectable preparations*—consult product literature.
  Dose adjustments Manufacturer advises consider dose reduction—consult product literature.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Possible association between acute chest syndrome in patients with sickle cell disease treated with morphine during a vaso-occlusive crisis—manufacturer advises close monitoring for acute chest syndrome symptoms during treatment.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *continuous intravenous infusion*, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
  - With intravenous use in neonates *Neonatal intensive care*, dilute 2.5 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour.
  - With oral use For *modified release capsules*—swallow whole or open capsule and sprinkle contents on soft food.
- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include *Filnarine® SR*, *MST Continus®*, *Morphgesic® SR* and *Zomorph®*. Preparations that should be given 24-hourly include *MXL®*.
  Prescriptions must specify the 'form'.
  - With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.
- **PATIENT AND CARER ADVICE**
  - With oral use Patients or carers should be given advice on how to administer morphine modified-release capsules. Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/medicines/morphine-for-pain/
- **EXCEPTIONS TO LEGAL CATEGORY**
  Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.
  Oral solutions of morphine can be prescribed by writing the formula:
  Morphine hydrochloride 5 mg
  Chloroform water to 5 mL

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

Oxycodone hydrochloride

20-Jul-2021

INDICATIONS AND DOSE

Severe pain

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients might require higher doses than the maximum daily dose; maximum 400 mg per day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
