

Hello, and welcome to the Create a Mobile App with in5 and PhoneGap Build course.

My name is Keith Gilbert, and I'll be your guide as you learn how to build an app for iOS, Android, and Windows mobile devices.

The method that I'll cover in this course involves laying out your app screens and content using InDesign, exporting the content with in5, and then using Adobe PhoneGap Build, which is free with your Creative Cloud membership, to bundle the output from in5 into a mobile app that's ready to submit to app stores.

In this course, I'll assume that you know how to use InDesign, and that you have familiarity with how in5 works. No other technical knowledge is required.

With InDesign, in5, and PhoneGap Build, you can build a mobile app without any programming skills.

One more thing you should know: You'll need to have access to a Macintosh computer for some of the iOS specific lessons, since some of those steps can't be done on a Windows computer. And, you can't submit an app to the Apple App Store from a Windows computer anyway.

I'm excited to show you how all this works. So, let's get started!
