Permutation & Combination

Permutation is arrangement of a set of objects.

Order is important in permutations.

Mathematically, permutation is given as follows:

$$P(n,r) = \frac{n!}{(n-r)!}$$

n = total number of objects

r = number of objects taken at a time.

$$P(n,n) = \frac{n!}{(n-n)!} = \frac{n!}{0!} = n!$$

Combination is arrangement of a set of objects.

Order is not important in combination.

Mathematically, it can be expressed as follows:

$$C(n,r) = \frac{P(n,r)}{r!}$$

n = total number of objects r = number of objects taken at a time.

$$C(n,n) = \frac{P(n,n)}{n!} = \frac{n!}{n!} = 1$$
