

Episode Title: Monitor servers and configure alerts by using Windows Admin Center

Objectives:

At the end of this episode, I will be able to:

1. Centralize management with Windows Admin Center
2. Integrate monitoring with Azure
3. Monitor common performance metrics

Key Points:

Key Point 1

Windows Admin Center provides centralized management with several advantages, including improved governance, security, compliance, and efficiency

Key Point 2

Azure provides integration with the Windows Admin Center to provide a single view from the Azure portal into performance and metrics of a Windows VM running in Azure.

Key Point 3

Common performance metrics include processing time, storage, networking, and memory. These are typically critical in monitoring application performance on a Windows server.

- If additional resources are used during the episode, they can be obtained using the download link on the overview episode (e.g. diagrams, no powerpoints)

External Resources:

If external resources were used during this episode, you can reference the following external resources for supplementary tools and information, if none were used, then this section will be blank:

- Managing Virtual Machines with Windows Admin Center
