

Episode Title: Migrate to Azure file shares

Objectives:

At the end of this episode, I will be able to:

1. Create a file share in an Azure storage account
2. Mount the file share using a UNC path
3. Plan for tiered storage using Azure File Sync

Key Points:

Key Point 1

Azure File Shares are part of a Azure Storage Accounts and provide SMB and NFS file shares to resources.

Key Point 2

These file shares can be mounted as UNC paths, assuming that you have network connectivity and permissions to access the share.

Key Point 3

Azure File Sync can be used with file shares to create cloud tiering for on-premises storage, moving inactive files to Azure storage.

- If additional resources are used during the episode, they can be obtained using the download link on the overview episode (e.g. diagrams, no powerpoints)

External Resources:

If external resources were used during this episode, you can reference the following external resources for supplementary tools and information, if none were used, then this section will be blank.:

- What is Azure File Sync?
