

API Usage Challenge

Goal

Create a Console app that will look up people in the SWAPI (www.swapi.co) based upon their ID number. Handle missing IDs/errors and load all the data for successful entries.

Bonus

Cache requests in memory. If you call the same call again, have it pull from the cache instead of from the API. Also, rename at least some of the properties to C#-style names without breaking the lookup.

"Practice makes the master."
