

## Razor Pages Challenge

### Goal

Create an ASP.NET Core Razor pages web application that has a SayHi page. The page should accept a person's name and then print "Hi \_\_\_\_" in a H1 tag on the page

### Bonus

Add authentication to the existing app (with a SQLite DB). The login should ask for "Corporate Email" (don't change the HTML), and below the password box, it should say "Never share or give out your password." in yellow.

*"Practice makes the master."*
