

## Fluid Mechanics

### Homework #2

The following problems are from the recommended textbook: *Fluid Mechanics*, 7<sup>th</sup> Edition by Frank White.

- Denver, Colorado has an average altitude of 5300 ft which has an atmospheric pressure of 83.4 kPa. On a US standard day, pressure gage A reads 83 kPa and gage B reads 105 kPa. Express these readings in gage or vacuum pressure, whichever is appropriate.
- A storage tank, 26 ft in diameter and 36 ft high, is filled with SAE 30W oil at 20°C ( $\rho = 1.73$  slugs/ft<sup>3</sup>). (a) What is the gage pressure, in lb/in<sup>2</sup>, at the bottom of the tank? (b) How does your result in (a) change if the tank diameter is reduced to 15 ft? (c) Repeat (a) if leakage has caused a layer of 5 ft of water ( $\rho = 1.94$  slugs/ft<sup>3</sup>) to rest at the bottom of the (full) tank.
- A closed tank contains 1.5 m of SAE 30 oil, 1 m of water, 20 cm of mercury, and an air space on top, all at 20°C. If the pressure at the bottom of the tank is 60 kPa, what is the pressure in the air space? ( $\gamma_{oil} = 8720$  N/m<sup>3</sup>,  $\gamma_{water} = 9790$  N/m<sup>3</sup>,  $\gamma_{Hg} = 133100$  N/m<sup>3</sup>)
- Pressure gage A reads 1.5 kPa (gage). The fluids are at 20°C. Determine the elevations  $z$ , in meters, of the liquid levels in the open piezometer tubes B and C. ( $\gamma_{air} = 12$  N/m<sup>3</sup>,  $\gamma_{gas} = 6670$  N/m<sup>3</sup>,  $\gamma_{gly} = 12360$  N/m<sup>3</sup>)

- The tank contains water ( $\rho = 998$  kg/m<sup>3</sup>) and oil at 20°C. What is  $h$  in cm if the density of the oil is 898 kg/m<sup>3</sup>?

6. If the absolute pressure at the interface between water and mercury is 93 kPa, what, in  $\text{lbf/ft}^2$ , is (a) the pressure at the surface and (b) the pressure at the bottom of the container? ( $\gamma_{\text{water}} = 9790 \text{ N/m}^3$ ,  $\gamma_{\text{Hg}} = 133100 \text{ N/m}^3$ )

7. The fuel gage for a gasoline tank in a car reads proportional to the bottom gage pressure as shown. If the tank is 30 cm deep and accidentally contains 2 cm of water plus gasoline, how many centimeters of air remain at the top when the gage erroneously reads "full"? ( $\gamma_{\text{water}} = 9790 \text{ N/m}^3$ )
