

Weekly Challenge

API ToDo App

Primary Challenge

Create an ASP.NET Core API ToDo app that uses a MongoDB as its storage mechanism. No authentication is needed. Ensure there are endpoints for Create, Update, Delete, List, and Complete (use the HTTP verbs of GET, POST, PUT, PATCH, and DELETE).

Bonus Challenge

Add in a Swagger display for your API so that users can see the API structure and test out the various endpoints.

“Practice makes the master.”
