PRACTICE PROBLEMS

NEWTON'S 1ST & 2ND LAWS

Newton's 1st & 2nd Laws of Motion

- 1. A force is... (select all that apply)
 - A an energy field that consists of a light side and a dark side that connects all living things
 - B a push or a pull that acts on an object
 - **C** a vector quantity
 - **D** something that is required to keep an object moving
- 2. The SI unit of force is...
 - A m
 - B kg
 - C N
 - D m/s²
- 3. Which of the following would be categorized as a contact force? (select all that apply)
 - A The tension force acting on a box that is pulled by a rope
 - B The gravitational force pulling an object down
 - C The friction force acting on the surface of a book sliding across a table
 - D The normal force acting upwards on a person sitting in a chair
- 4. Which of the following should be included in a free body diagram? (select all that apply)
 - A The object that we're focusing on, or a dot that represents the object as a particle
 - B All of the forces acting on the object that we're focusing on, represented as vectors
 - C The objects that are causing the forces on the object that we're focusing on
 - **D** A coordinate system (the direction of the positive **x** and **y** axes)
- 5. Newton's 1st law of motion states that an object at rest will remain at rest if...
 - A there are no forces acting on the object
 - B the object is sitting on the ground
 - **C** the object has zero energy
 - D there is no net force (no unbalanced force) acting on the object
- 6. According to Newton's 1st law of motion, an object that is moving at a constant velocity...
 - A must have one force acting on it in the direction of the velocity
 - B must have no forces acting on it
 - c must have a net force acting on it in the direction of the velocity
 - D must have no net force acting on it
- 7. Inertia is... (select all that apply)
 - A an object's tendency to remain at rest
 - B an object's tendency to remain in motion
 - C an object's tendency to resist changes to its motion
 - **D** related to an object's mass

- 8. According to Newton's 2nd law of motion, an object's acceleration depends on... (select all that apply)
 - A the mass of the object
 - B the velocity of the object
 - **C** the net force acting on the object
 - **D** the energy of the object
- 9. True or false: If you know the magnitude and direction of every force acting on an object, you can determine the direction that the object is moving.
 - A True
 - B False
- 10. The SI unit for mass is...
 - A N
 - B kg
 - c lb
 - D m
- 11. An object of mass *m* experiences a single force *F*. The object's acceleration would be...
 - A Fm
 - B m/F
 - C F/m
 - **D** 0
- 12. An object with a mass of 5 kg is accelerating at 2 m/s². The net force acting on the object must be...
 - A 2 N
 - в 2.5 N
 - **C** 5 N
 - D 10 N
- 13. A 25 N net force is acting on an object with a mass of 5 kg. The object's acceleration is...
 - A 2.5 m/s²
 - B 5 m/s²
 - C 10 m/s²
 - D 25 m/s²
- 14. A 6 N force is acting on an object which causes it to accelerate at 3 m/s². If no other forces are acting on the object, the object's mass must be...
 - A 2 kg
 - B 3 kg
 - **C** 6 kg
 - D 12 kg

Newton's 1st & 2nd Laws - Practice Problems

♣ physicslab.app

- 15. A 4 kg object is moving at 6 m/s to the right when it experiences a 12 N force pushing it to the right and a 12 N force pushing it to the left (and no other forces are present). What will happen to the object's speed?
 - A It will increase
 - B It will stay the same
 - C It will decrease
 - D Cannot be determined
- 16. An object with a mass of 2 kg experiences a net force with a magnitude of F_1 and accelerates at 6 m/s². A second object experiences the same net force and accelerates at 4 m/s². What is the mass of the second object?
 - A 2 kg
 - B 3 kg
 - C 4 kg
 - D 6 kg
- 17. A box is being pulled to the right by the tension force in a rope. A friction force is acting to the left, the weight force is acting downwards, and a normal force is acting upwards. Which of the following could be a free body diagram of the box? (select all that apply)

- 18. A free body diagram of an object is shown on the right. Which of the following describe the net forces acting on the object?
 - $A \Sigma F_{x} = F_{2} + F_{1} , \Sigma F_{y} = 0$
 - $\mathbf{B} \ \Sigma F_{\mathrm{x}} = F_{\mathrm{2}} F_{\mathrm{1}} \ , \ \Sigma F_{\mathrm{y}} = \mathbf{0}$
 - $\Sigma F_x = F_2$, $\Sigma F_y = F_1$
 - **D** $\Sigma F_{x} = 0$, $\Sigma F_{y} = 0$
- 19. A free body diagram of an object is shown on the right. Which of the following describe the net forces acting on the object?

 $A \Sigma F_{x} = F_{1} - F_{2} , \Sigma F_{y} = F_{3}$

B $\geq F_x = -F_3$, $\geq F_y = F_1 + F_2$ C $\sum F_x = F_3$, $\sum F_y = F_1 + F_2$ D $\sum F_x = F_3$, $\sum F_y = F_1 - F_2$

20. A free body diagram of an object is shown on the right. Which of the following describe the net forces acting on the object?

A
$$\Sigma F_x = F_4 - F_3$$
, $\Sigma F_y = F_1 + F_3 - F_2$
B $\Sigma F_x = F_4 - F_3 \sin(\theta)$, $\Sigma F_y = F_1 + F_3 \cos(\theta) - F_2$
C $\Sigma F_x = F_4 - F_3 \cos(\theta)$, $\Sigma F_y = F_1 + F_3 \sin(\theta) - F_2$
D $\Sigma F_x = F_4$, $\Sigma F_y = F_1 + F_3 - F_2$

✤ physicslab.app

- 21. A free body diagram of an object is shown on the right. Which of the following represent Newton's 2nd law applied to this object?
 - A $\sum F_x = F_2 + F_3 F_1 = ma_x$, $\sum F_y = -F_4 = ma_y$ B $\sum F_x = F_2 - F_3 - F_1 = ma_x$, $\sum F_y = -F_4 = ma_y$ C $\sum F_x = F_1 + F_2 + F_3 = ma_x$, $\sum F_y = F_4 = ma_y$ D $\sum F_x = F_1 - F_2 - F_3 = ma_x$, $\sum F_y = F_4 = ma_y$

23. A free body diagram of an object is shown on the right. Which of the following show the direction of the object's acceleration? Note that the vectors are not drawn to scale.

- 24. A free body diagram of a 4 kg object is shown on the right. What is the magnitude of the object's acceleration?
 - A 4 m/s²
 - B 2 m/s²
 - C 0.5 m/s²
 - D 0 m/s²

A 1 kg

B 2 kg

C 3 kg

D 5 kg

- 25. A free body diagram of a 3 kg object is shown on the right. If a_x is 1 m/s² and a_y is -1 m/s², what are the magnitudes of F_1 and F_2 ?
 - A $F_1 = 2 \text{ N}$, $F_2 = 15 \text{ N}$ B $F_1 = 15 \text{ N}$, $F_2 = 2 \text{ N}$

C $F_1 = 8 \text{ N}$, $F_2 = 9 \text{ N}$

Answers - Newton's 1st & 2nd Laws of Motion

1. Answer: B, C

A force is a push or a pull that acts on an object and is caused by something else. Forces are vector quantities which means they have a magnitude and a direction. Although forces are related to an object's motion, Newton's 1st law of motion states that an object will keep moving if there are no forces acting on it.

2. Answer: C

The SI unit for force is the Newton (N) which equivalent to $kg \cdot m/s^2$.

3. Answer: A, C, D

Tension, friction and normal forces are contact forces because they act on object through direct contact. Gravitational force is a non-contact force because the earth applies the force on an object without direct contact.

4. Answer: A, B, D

A free body diagram is used to illustrate all of the forces acting on a single object. It should include the object we're focusing on, all of the forces acting on that object (represented as vectors), and the choice of coordinate system so we know which are the positive *x* and *y* directions. A free body diagram should not include any other objects or the environment.

5. Answer: D

Newton's 1st law of motion specifically states that an object at rest will remain at rest if there is no net force (or no unbalanced force) acting on the object. There may be forces acting on the object and it still remains at rest if those forces are balanced in opposite directions (the net force is zero).

6. Answer: D

Newton's 1st law of motion states that an object that is moving with a constant velocity must have no net force acting on it. There may be forces acting on the object, but they would be balanced in opposite directions. An object does not require a force to continue moving at a constant velocity.

7. Answer: A, B, C, D

All of these accurately represent the concept of inertia as described in Newton's 1st law of motion. An object's inertia is proportional to its mass, which is further described in Newton's 2nd law of motion.

8. Answer: A, C

Newton's 2nd law is represented by the equation $\vec{F}_{net} = m\vec{a}$, so the acceleration depends on the object's mass and the net force acting on the object.

9. Answer: B, False

If you know the magnitude and direction of every force acting on an object you can determine the magnitude and direction of the net force and the acceleration, but not the direction of the velocity. From kinematics, an acceleration tells you how the velocity is changing over time but you would need to know more information to know the object's velocity at a particular time.

10. Answer: B

The SI unit for mass is the kilogram (kg).

11. Answer: C

The object's acceleration is given by Newton's 2nd law of motion.

F = ma a = F/m

12. Answer: D

 $F_{\text{net}} = ma = (5 \text{ kg})(2 \text{ m/s}^2) = 10 \text{ N} = 10 \text{ kg} \cdot \text{m/s}^2$

13. Answer: B

 $F_{\rm net} = ma$ (25 N) = (5 kg)a $a = 5 \text{ m/s}^2$

14. Answer: A

 $F_{\rm net} = ma$ (6 N) = $m(3 \text{ m/s}^2)$ m = 2 kg

15. Answer: B

Because the two forces are equal in magnitude and acting in opposite directions, the net force acting on the object is zero so the acceleration is also zero. That means the object's speed will not change.

16. Answer: B

The magnitude of F_1 can be found from the motion of the first object, which can then be used to find the mass of the second object:

 $\sum F = ma$ $F_1 = (2 \text{ kg})(6 \text{ m/s}^2)$ $F_1 = 12 \text{ N}$ $\sum F = ma$ $12 \text{ N} = m(4 \text{ m/s}^2)$ m = 3 kg

17. Answer: C, D

A free body diagram of the box shows the box (represented either by a picture of just the box, or a dot which represents the box as a particle) and all of the forces acting on the box. It does not show any other objects.

18. Answer: B

 F_2 acts in the positive x direction so it has a positive value, and F_1 acts in the negative x direction so it has a negative value. There are no forces acting in the y direction.

19. Answer: D

 F_3 acts in the positive x direction so it has a positive value. F_1 acts in the positive y direction so it has a positive value, and F_2 acts in the negative y direction so it has a negative value.

20. Answer: C

 F_4 acts in the positive x direction so it has a positive value. F_1 acts in the positive y direction so it has a positive value, and F_2 acts in the negative y direction so it has a negative value. F_3 acts at an angle so it has force components in the x and y directions: the x component is $F_3 \cos(\theta)$ which acts in the negative x direction, and the y component is $F_3 \sin(\theta)$ which acts in the positive y direction.

✤ physicslab.app

21. Answer: A

 F_2 and F_3 act in the positive x direction, and F_1 acts in the negative x direction. F_4 acts in the negative y direction. Newton's 2nd law of motion applies to the x and y directions: $\sum F_x = ma_x$, $\sum F_y = ma_y$.

22. Answer: B, C

In options B and C the net horizontal force is to the left and the net vertical force is zero, so the object will accelerate to the left. The object in option A has zero net force and will not accelerate. The object in option D has a net horizontal force to the left and a net vertical force upwards, so the object will accelerate to the left and upwards (not just horizontally to the left).

23. Answer: D

The net horizontal force is 3 N to the left and the net vertical force is 8 N up. The net force acting on the object is up and to the left, which is the same direction as the acceleration.

24. Answer: C

 $\Sigma F_x = ma_x$ $\Sigma F_x = 6 N - 4 N = 2 N = (4 \text{ kg})a_x$ $a_x = 0.5 \text{ m/s}^2$

25. Answer: A

$$\sum F_x = ma_x \qquad \sum F_x = F_2 - 12 \text{ N} = (3 \text{ kg})(1 \text{ m/s}^2) \qquad F_2 = 15 \text{ N}$$

$$\sum F_y = ma_y \qquad \sum F_y = F_1 - 5 \text{ N} = (3 \text{ kg})(-1 \text{ m/s}^2) \qquad F_1 = 2 \text{ N}$$

26. Answer: B

 $\sum F_y = ma_y$ $\sum F_y = 16 \text{ N} - 5 \text{ N} - 5 \text{ N} = m(3 \text{ m/s}^2)$ m = 2 kg

27. Answer: 3.5 m/s²

$$\begin{split} &\sum F_x = ma_x \qquad \sum F_x = 20 \text{ N} - 6 \text{ N} = (4 \text{ kg})a_x \qquad a_x = 3.5 \text{ m/s}^2 \\ &\sum F_y = ma_y \qquad \sum F_y = 8 \text{ N} - 8 \text{ N} = (4 \text{ kg})a_y \qquad a_y = 0 \text{ m/s}^2 \\ &a = 3.5 \text{ m/s}^2 \end{split}$$
 (there is no y component of the acceleration vector)

28. Answer: 11 m/s

The acceleration a is 3.5 m/s² which was found in a previous question. $v_f = v_i + a\Delta t$ $v_f = (4 \text{ m/s}) + (3.5 \text{ m/s}^2)(2 \text{ s})$ $v_f = 11 \text{ m/s}$

29. Answer: 15.8 m

The acceleration a is 3.5 m/s² which was found in a previous question.

$$x_f = x_i + v_i t + \frac{1}{2}at^2$$
 $x_f = (0 \text{ m}) + (0 \text{ m/s})(3 \text{ s}) + \frac{1}{2}(3.5 \text{ m/s}^2)(3 \text{ s})^2$ $x_f = 15.8 \text{ m}$

30. Answer: 3.2 m/s² at an angle of 70°

$$\sum F_x = ma_x \qquad \sum F_x = (6 \text{ N})\cos(30^\circ) - 3 \text{ N} = (2 \text{ kg})a_x \qquad a_x = 1.1 \text{ m/s}^2$$

$$\sum F_y = ma_y \qquad \sum F_y = 4 \text{ N} + (6 \text{ N})\sin(30^\circ) - 1 \text{ N} = (2 \text{ kg})a_y \qquad a_y = 3 \text{ m/s}^2$$

 a_x and a_y are the components of the acceleration vector a. The magnitude and direction of a are:

$$a^{2} = a_{x}^{2} + a_{y}^{2} \qquad a = \sqrt{a_{x}^{2} + a_{y}^{2}} \qquad a = \sqrt{(1.1 \text{ m/s}^{2})^{2} + (3 \text{ m/s}^{2})^{2}} = 3.2 \text{ m/s}^{2}$$
$$\theta = \tan^{-1} \left(\frac{a_{y}}{a_{x}}\right) \qquad \theta = \tan^{-1} \left(\frac{3 \text{ m/s}^{2}}{1.1 \text{ m/s}^{2}}\right) = 70^{\circ}$$
