

File Management Challenge

Goal

Using C#, copy all of the files from one folder to another folder. Do not overwrite existing files.

Bonus

Ensure that all sub-folders and files are copied as well. Include a switch in your method that allows you to flatten the file structure (all in one folder). When doing so, rename the files to include the folder names like so:

Folder1_FileName.txt if it came from the subfolder Folder1.

"Practice makes the master."
