

Hyper-V and Guest Virtual Machines

Implement High Availability for VMs

Objectives:

At the end of this episode, I will be able to:

1. Implement high availability for virtual machines.

Key Points:

To ensure that a replica of a VM has the same FQDN, what is the recommendation for the replica partner Hyper-V hosts?

Which tool is used to configure replica partners?

Which option in Hyper-V Manager must be configured for both replica partners to enable them as replica servers?

What will you likely need to do in Windows Defender Firewall so that the replica partners can communicate?

What must you do to each VM that you want replicated to a replica partner?

List and discuss the steps for configuring replication for a VM.
