

Error Handling Challenge

Goal

Stop the errors! If an exception occurs in the `MakePayment` method, catch it and print “Payment skipped for payment with 4 items” (or whatever the number is). However, the method properly returns a null one time. Fix that error (don’t just catch it) and print “Null value for item 4” instead.

Bonus

Handle the different errors differently. If you get an `IndexOutOfRangeException` exception, print “Skipped invalid record”. If it is a `FormatException` and the number of items is not 5, print “Formatting Issue”. For everything else, print the standard error.

If an exception has an `InnerException`, print the `Message` of the `InnerException` at the end of whatever message is being displayed.

“Practice makes the master.”
