

## Quality over quantity

---

I deleted over 40 hours of content to make this course digestible in a single day. I believe that you can find a lot of information about web development on the Internet and I didn't want to create yet another encyclopedia about web technologies.

I wanted to create the course with a focus on one single goal - to make you a web developer, to ignite that fire inside you, to inspire you, to motivate you.

The goal of this course is to give you only what you really need, nothing more. I don't want to waste your time with hours and hours of content, I don't want you to skip lectures trying to find what's relevant. I did it myself by deleting almost 80% of the original content leaving only the most important stuff so you can create your own web application.

I hope this will help you understand what the web development is about, I don't want you to start thinking above specific languages and technologies, I want you to start thinking about principles. That's why I try to give you only what's absolutely necessary from the theoretical part and I want to push you as soon as possible to get your hands dirty with a real work.

But I didn't stop there, I deliberately start slowly and gradually gain speed. I want the course to be challenging for you, I will help you step by step, but I want you to think about the code. That's why you will get the whole snippets of code which you can either just blindly copy & paste or try to understand and ideally even improve and optimize!

I hope you will further develop your final project, add new features and improve yourself on your own along the way.

Treat this course as a starting point which goal is to push you in the right direction and leave you to thrive on your own.
