

Git installation

If Git is not working on your Win machine even after restart, run this command from Command Prompt:

```
set PATH=%PATH%;"C:\Program Files\Git\cmd"
```

This command will add Git to your environment, so Command Prompt will know where it is located.

If you already have Git installed on your machine, but want the latest version, you can just run this command:

```
git clone https://github.com/git/git
```
