

Packages, Imports, Exports

Takeaways

package = a group of definitions under the same name

To use a definition

- be in the same package
- or import the package

Best practice – mirror the file structure

Fully qualified name

Name aliasing at imports

Exports

- can use a member's field/method directly

```
// Person.scala  
package org.rtdvm.oop  
  
class Person  
object Person
```

```
import java.sql.{ Date => SqlDate }  
import java.util.{ Date => JavaDate }  
import java.{ util => ju }
```

```
export myInstance.someField
```

Scala rocks
