

Database Design Challenge

Goal

Design a database project in Visual Studio that holds information about people on your Christmas list. Store a list of friends and family, their addresses, what items you bought for them, and how much each item cost.

Bonus

Include a budget amount for each person. Create a view that identifies who you have left to shop for and how much you have left to spend. Also, create stored procedures to capture purchases.

"Practice makes the master."

— Patrick Rothfuss
